## Chapter 7 Solution Chemistry

### 7.1 The Nature of Solutions

Warm Up (p. 364) and Quick Check (p. 365)

|  | Pure substance | Mixture |
| :--- | :--- | :--- |
| Car exhaust |  | $\sqrt{ }$ |
| Tap water |  | $\sqrt{ }$ solution |
| Carbon dioxide | $\sqrt{2}$ |  |
| Freshly squeezed orange juice |  | $\sqrt{ }$ |
| Stainless steel |  | $\sqrt{ }$ solution |
| tea |  | $\sqrt{ }$ solution |
| diamond | $\sqrt{ }$ |  |
| Cigarette smoke |  | $\sqrt{ }$ |

## Practice Problems - Converting Between Units of Solubility (p. 366)

2. solubility $=\underline{1.4 \times 10^{-6} \mathrm{~mol}} \times \underline{462.6 \mathrm{~g} \times \underline{1 \mathrm{~L}}}=6.5 \times 10^{-7} \mathrm{~g} / \mathrm{mL}$
 $500 \mathrm{~mL} \quad 1434 \mathrm{~g} \quad 1 \mathrm{~L}$

Quick Check (p. 367)

1. An anion is a negative ion. A cation is a postive ion.
2. Alkali ions, $\mathrm{H}^{+}$and $\mathrm{NH}_{4}{ }^{+}$compounds are always soluble.
3. Nitrate compounds are always soluble.
4. Phosphate, carbonate and sulphite have low solubility.

Practice Problems- Predicting the Relative Solubility of Salts in Water (p.368)

1. NaCl - soluble
2. Zinc sulphite - low solubility
3. $\mathrm{CaCO}_{3}$ - low solubility
4. Ammonium hydroxide - soluble
5. $\mathrm{CuCl}_{2}-$ soluble
6. Cesium phosphate - soluble
7. $\mathrm{Al}_{2}\left(\mathrm{SO}_{4}\right)_{3}$ - soluble
8. Copper(I) chloride - low solubility
9. BaS - soluble
10. Chromium(III) nitrate - soluble
7.1 Activity (p. 369)

## Results and Discussion

1. NaNO3
2. No. At $0^{\circ} \mathrm{C}, \mathrm{KClO}_{3}$ has the lowest solubility. At $90^{\circ} \mathrm{C}, \mathrm{Ce}_{2}\left(\mathrm{SO}_{4}\right)_{3}$ has the lowest solubility.
3. Increases
4. $\mathrm{Ce}_{2}\left(\mathrm{SO}_{4}\right)_{3}$

### 7.1 Review Questions

1. Define homogeneous, heterogeneous, pure substance, and mixture. Give an example for each. Homogeneous - is uniform throughout and exists in one phase. Ie. Alcohol and water
Heterogeneous - is not uniform throughout. Ie. Oil and vinegar
Pure substance - contains only one type of particle (atom or molecule). Ie. Gold or water Mixture - contains 2 or more components. Ie. Salt water
2. Classify the following as a pure substance or a mixture. If it is a mixture, then state whether or not it is a solution.
(a) distilled water - pure substance
(b) 9 carat gold - mixture - solution
(c) gasoline - mixture - solution
(d) wood - mixture - not a solution
(e) bronze - mixture - solution
(f) chocolate chip ice cream - mixture - not a solution
(g) coffee - mixture - solution
(h) coal - pure substance
3. Complete the following sentences using the terms solute, solvent, miscible, and immiscible. A solution is composed of a solute and solvent. The solvent is the substance that makes up the larger part of the solution. If two components can be mixed in any proportions to make a homogeneous mixture, they are miscible.
4. Give an example of two substances that are immiscible when mixed. Describe what you would see if you mixed them together.
Paint thinner and water are immiscible. You would see 2 layers of liquid that did not mix.
5. When the solubility of a substance is given, what information must be specified?

The amount of solute in a specified volume of solution at a particular temperature.
6. The molar solubility of lead(II) bromide is $2.6 \times 10^{-3} \mathrm{M}$. What is its solubility in $\mathrm{g} / \mathrm{ml}$ ?
solubility $=\frac{2.6 \times 10^{-3} \mathrm{~mol}}{\mathrm{~L}} \times \frac{367 \mathrm{~g}}{1 \mathrm{~mol}} \times \frac{1 \mathrm{E}}{1000 \mathrm{~mL}}=9.5 \times 10^{-4} \mathrm{~g} / \mathrm{mL}$
7. A saturated solution contains $0.0015 \mathrm{~g} \mathrm{CaC}_{2} \mathrm{O}_{4}$ dissolved in 250 mL solution. What is the molar solubility of $\mathrm{CaC}_{2} \mathrm{O}_{4}$ ?

Solubility $=\frac{0.0015 \mathrm{~g}}{250 \mathrm{~mL}} \quad \mathrm{x} \quad \frac{1 \mathrm{~mol}}{128.1 \mathrm{~g}} \quad \times \quad \frac{1000 \mathrm{~mL}}{1 \mathrm{~L}}=4.7 \times 10^{-5} \mathrm{M}$
8. The molar solubility of $\mathrm{AgIO}_{3}$ is $1.8 \times 10^{-4} \mathrm{M}$. Express its solubility in $\mathrm{g} \mathrm{AgIO}_{3} / \mathrm{mL}$ water. Assume that the volume of solvent $=$ volume of solution.
solubility $=\frac{1.8 \times 10^{-4} \mathrm{~mol}}{\mathrm{~L}} \times \frac{282.8 \mathrm{~g}}{1 \mathrm{~mol}} \times \frac{1 \mathrm{~L}}{1000 \mathrm{~mL}}=5.1 \times 10^{-5} \mathrm{~g} / \mathrm{mL}$
9. What does the term aqueous mean?

Dissolved in water
10. Using Table 7.1.1, list three salts containing the sulphide anion that would have a low solubility in water at $25^{\circ} \mathrm{C}$.
Many possible answers. For example: FeS, CuS and ZnS
11. Using Table 7.1.1, list three salts containing the anion carbonate that would be soluble at $25^{\circ} \mathrm{C}$.
Many possible answers. For example: $\mathrm{Na}_{2} \mathrm{CO}_{3},\left(\mathrm{NH}_{4}\right)_{2} \mathrm{CO}_{3}, \mathrm{~K}_{2} \mathrm{CO}_{3}$
12. List the cations in a salt that are soluble when paired with any anion.
$\mathrm{H}^{+}, \mathrm{NH}_{4}^{+}, \mathrm{Li}^{+}, \mathrm{Na}^{+}, \mathrm{K}^{+}, \mathrm{Rb}^{+} \mathrm{Cs}^{+}, \mathrm{Fr}^{+}$,
13. Classify each of the following compounds as soluble or low solubility according to Table 7.1.1.
(a) $\mathrm{H}_{2} \mathrm{SO}_{4}$ soluble
(b) MgS soluble
(c) $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{SO}_{3}$ soluble
(d) RbOH soluble
(e) $\mathrm{PbSO}_{4}$ low solubility
(f) $\mathrm{CuBr}_{2}$ soluble
(g) $\mathrm{Zn}\left(\mathrm{NO}_{3}\right)_{2}$ soluble
(h) $\mathrm{FeSO}_{4}$ soluble
14. A student dissolves 0.53 g of $\mathrm{LiCH}_{3} \mathrm{COO}$ in water at $25^{\circ} \mathrm{C}$ to make 100 mL of solution. Is the solution formed saturated or unsaturated? Justify your answer with calculations and by referring to Table 7.1.1.
$\left[\mathrm{LiCH}_{3} \mathrm{COO}\right]=\frac{0.53 \mathrm{~g}}{100 \mathrm{~mL}} \times \frac{1 \mathrm{~mol}}{65.9 \mathrm{~g}} \times \frac{1000 \mathrm{~mL}}{1 \mathrm{~L}}=0.080 \mathrm{M}$.
According to the solubility table, alkali ions are soluble with all anions. Soluble means a solubility of greater than 0.1 M . This solution is unsaturated.

## Section 7.2

Warm Up

| Substance | Intermolecular Forces Present |
| :--- | :--- |
| Example: $\mathrm{H}_{2} \mathrm{O}$ | hydrogen bonding, dipole-dipole, dispersion forces |
| $\mathrm{I}_{2}$ | Dispersion forces |
| HF | hydrogen bonding, dipole-dipole, dispersion forces |
| $\mathrm{PCl}_{3}$ | Dispersion forces |
| $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH}$ | dipole-dipole, dispersion forces |

p. 3 Quick check

1. The NaCl has positive and negative ions, and the water has positive and negative dipoles. The positive sodium ion is attracted to the negative dipole on the oxygen atom of the water molecule. The negative chloride ion is attracted to the positive dipole on the hydrogen atom of the water molecule.
2. Water molecules are attracted to each other by hydrogen bonds. The iodine molecules cannot overcome that attraction between water molecules to get between them.
3. $\mathrm{No}, \mathrm{NaCl}$ is ionic and oil is non-polar covalent. They are not "like".
4. ammonia:

dipole-dipole force

NaCl

ionic bonds
p. 6 Quick Check

1. Yes - ammonia is polar and so is water. They are "like".
2. No. Ethanol is polar and hexane is non-polar. They are not "like".
3. $\mathrm{CH}_{3} \mathrm{OH}$ is more soluble in water. Water is polar so it will be attracted to the polar end on $\mathrm{CH}_{3} \mathrm{OH} . \mathrm{C}_{2} \mathrm{H}_{6}$ is non-polar so is not "like" water.
4. The large non-polar part of octanol is not able to get between water molecules and overcome the attraction that each water molecule has for another water molecule. Larger alcohols are almost insoluble in water.
p. 7 Quick Check
5. Yes - iodine is also non-polar covalent. Like dissolves like.
6. Mothballs are non-polar so they will dissolve better in paint thinner which is also non-polar.
7. The solid iodine will dissolve in the paint thinner layer only. It will become pink while the water layer remains clear and colorless.
8. The water molecules are attracted to each other through hydrogen bonds. The $\mathrm{CCl}_{4}$ molecules are not able to overcome this attraction and get between the water molecules. Water is polar and $\mathrm{CCl}_{4}$ is non-polar. They are not "like".

### 7.2 Activity: Determining the Bond Type of a Solute

## Results and Discussion

1 . What types of intermolecular forces exist in water? In tetrachloroethene?
Water contains hydrogen bonds and dipole-dipole bonds. Tetrachloroethene is non-polar covalent so only contains dispersion forces.
2. State the two possible bond types or intramolecular bonds present in the solute.

The stain must be polar covalent or ionic.
3. Explain why the stain did not dissolve in tetrachloroethene.

The stain is polar or ionic and tetrachloroethene is non-polar. They are not "like".
4. Explain why you cannot narrow down the solute bond type to just one type.

Because both ionic and polar compounds dissolve in polar covalent solvents.
5. Compare your answers to those of another group. How do they compare?

### 7.2 Review Questions

1. Explain the phrase "like dissolves like" in your own words.

Solutes that have a similar type of intermolecular forces as a solvent will dissolve.
2. Is ethanol hydrophilic or hydrophobic? Explain using a diagram.

Hydrophilic
3. Is $\mathrm{Br}_{2}(l)$ more soluble in $\mathrm{CS}_{2}(l)$ or $\mathrm{NH}_{3}(l)$ ? Explain.
$\mathrm{Br}_{2}$ is non-polar so is more soluble in $\mathrm{CS}_{2}$ which is also non-polar. $\mathrm{NH}_{3}$ is polar so is not "like" $\mathrm{Br}_{2}$.
4. Explain why $\mathrm{NH}_{3}$ is very soluble in water, but $\mathrm{NCl}_{3}$ is not.

NH 3 is polar just like water. $\mathrm{NCl}_{3}$ is non-polar so will not dissolve in water.
5. When $I_{2}$ is added to water, it does not dissolve. However, if $I_{2}$ is added to an aqueous solution of KI, it will dissolve. Use the following reaction, and your understanding of intermolecular forces to explain the above observations.
$\mathrm{I}_{2}(s)+\mathrm{I}^{-}(a q) \rightarrow \mathrm{I}_{3}{ }^{-}(a q)$
$\mathrm{I}_{2}$ is non-polar so will not dissolve in polar water. If the water contains $\mathrm{I}^{-}$ions however, the $\mathrm{I}_{2}$ reacts to form $\mathrm{I}_{3}^{-}(\mathrm{aq})$ which is ionic. This ion will then be attracted to the positive dipole on the hydrogen atoms on the water molecules.
6. Which is more soluble in water? Explain.
(a) $\mathrm{C}_{4} \mathrm{H}_{10}$ or $\mathrm{C}_{3} \mathrm{H}_{6} \mathrm{OH} \mathrm{C} \mathrm{C}_{3} \mathrm{H}_{6} \mathrm{OH}$ - it contains a polar end that is attracted to the polar water molecules
(b) $\mathrm{MgCl}_{2}$ or toluene $\left(\mathrm{C}_{7} \mathrm{H}_{8}\right) \mathrm{MgCl}_{2}$ is ionic so will dissolve better in water. Toluene is nonpolar.
7. Glycerin is a common solvent and is found in many skin care products. A student mixed 10 mL of water, 10 mL of glycerin and 10 mL of carbon tetrachloride together. A small amount of $\mathrm{CuCl}_{2}$ was added to the mixture. Explain what you would see.

## BCch11-7.2-16-glycerin

Glycerin
The glycerin and water would mix together but the carbon tetrachloride would remain as a separate layer. The $\mathrm{CuCl}_{2}$ would dissolve into the water/glycerin layer and would color that layer blue.
8. Ethylene glycol is commonly used as antifreeze. In which solvent would antifreeze be most soluble?

BCch11-7.2-17-ethylglyc
Ethylene glycol
(a) water or paint thinner (a non-polar covalent solvent)
water. Water and ethylene glycol are both polar.
(b) ammonia or carbon tetrachloride ammonia. Ammonia and ethylene glycol are both polar.
(c) hexene $\left(\mathrm{C}_{6} \mathrm{H}_{12}\right)$ or glycerin (a polar covalent solvent)
glycerin. Glycerin and ethylene glycol are both polar.
9. List the intermolecular forces present between the following solutes and solvents:
(a) CsCl in $\mathrm{H}_{2} \mathrm{O}$

CsCl is ionic. Water contains hydrogen bonds, dipole-dipole bonds and dispersion forces.
(b) $\mathrm{CH}_{3} \mathrm{OH}$ in glycerin
$\mathrm{CH}_{3} \mathrm{OH}$ is polar and contains hydrogen bonds, dipole-dipole forces and dispersion forces.
Glycerin is polar and contains hydrogen bonds, dipole-dipole forces and dispersion forces.
(c) $\mathrm{N}_{2}$ in $\mathrm{C}_{8} \mathrm{H}_{18}$
$\mathrm{N}_{2}$ contains only dispersion forces as does $\mathrm{C}_{8} \mathrm{H}_{18}$
(d) acetone in ammonia

BCch11-7.2-18-acetone
Acetone

Acetone contains dipole-dipole forces and dispersion forces. Ammonia contains hydrogen bonds, dipole-dipole forces and dispersion forces.

## Section 7.3

## Warm Up:

1. For a strong cup of coffee, you would use a large amount of coffee for a given volume of water.
2. To dilute the coffee, you would add more water or milk.
3. No, you have not changed the amount of caffeine in the coffee because you have not added any more coffee. You have simply increased the volume of solution.

## Practice Problems - Dilution Calculations

1. $[\mathrm{NaOH}]=\underline{0.100 \mathrm{~mol}} \times \underline{0.0500 \mathrm{E}}=0.0625 \mathrm{M}$
$1 \mathrm{~L} \quad 0.0800 \mathrm{~L}$
2. $\left[\mathrm{H}_{2} \mathrm{SO}_{4}\right]=\underline{1.5 \mathrm{~mol} \times 0.0350 \mathrm{~L}}=1.1 \mathrm{M}$

$$
1 \mathrm{E} \quad 0.0500 \mathrm{~L}
$$

3. $\left[\mathrm{Ca}\left(\mathrm{NO}_{3}\right)_{2}\right]$ original solution $=\underline{0.25 \mathrm{~g} \times 1 \mathrm{~mol}=0.015 \mathrm{M}}$

$$
0.100 \mathrm{~L} \quad 164.1 \mathrm{~g}
$$

$$
\left[\mathrm{Ca}\left(\mathrm{NO}_{3}\right)_{2}\right] \text { diluted solution }=\frac{0.015 \mathrm{~mol}}{1 \mathrm{~L}} \times \frac{0.0500 \mathrm{~L}}{0.0750 \mathrm{~L}}=0.010 \mathrm{M}
$$

4. $\left[\mathrm{K}_{2} \mathrm{CrO}_{4}\right]=\underline{0.40 \mathrm{~mol} \times \underline{0.0180 \mathrm{E}}=0.19 \mathrm{M}, ~}$

$$
1 \mathrm{~L} \quad \overline{0.0380 \mathrm{~L}}
$$

## Quick Check

Write balanced dissociation equations for each salt when it is dissolved in water.

1. $\mathrm{Al}\left(\mathrm{NO}_{3}\right)_{3}(\mathrm{aq}) \rightarrow \mathrm{Al}^{3+}(\mathrm{aq})+3 \mathrm{NO}_{3}{ }^{-}(\mathrm{aq})$
2. $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{SO}_{4}(\mathrm{aq}) \rightarrow 2 \mathrm{NH}_{4}{ }^{+}(\mathrm{aq})+\mathrm{SO}_{4}{ }^{2-}(\mathrm{aq})$
3. potassium chromate $\mathrm{K}_{2} \mathrm{CrO}_{4}(\mathrm{aq}) \rightarrow 2 \mathrm{~K}^{+}(\mathrm{aq})+\mathrm{CrO}_{4}{ }^{2-}(\mathrm{aq})$
4. zinc phosphate $\mathrm{Zn}_{3}\left(\mathrm{PO}_{4}\right)_{2}(\mathrm{aq}) \rightarrow 3 \mathrm{Zn}^{2+}(\mathrm{aq})+2 \mathrm{PO}_{4}{ }^{3-}(\mathrm{aq})$

## Quick Check

Calculate the concentration of all ions in each of the following. Begin by writing the balanced dissociation equation for each.

2. $0.50 \mathrm{M} \mathrm{Na} 2 \mathrm{CO}_{3}: \mathrm{Na}_{2} \mathrm{CO}_{3}(\mathrm{aq}) \rightarrow 2 \mathrm{Na}^{+}(\mathrm{aq})+\mathrm{CO}_{3}{ }^{2-}(\mathrm{aq})$ $0.050 \mathrm{M} \quad 1.0 \mathrm{M} \quad 0.50 \mathrm{M}$
3. 1.5 M ammonium oxalate: $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{C}_{2} \mathrm{O}_{4}(\mathrm{aq}) \rightarrow 2 \mathrm{NH}_{4}{ }^{+}(\mathrm{aq})+\mathrm{C}_{2} \mathrm{O}_{4}{ }^{2-}(\mathrm{aq})$

$$
\begin{array}{lll}
1.5 \mathrm{M} & 3.0 \mathrm{M} & 6.0 \mathrm{M}
\end{array}
$$

4. $3.2 \times 10^{-3} \mathrm{M}$ calcium phosphate $: \mathrm{Ca}_{3}\left(\mathrm{PO}_{4}\right)_{2}(\mathrm{aq}) \rightarrow 3 \mathrm{Ca}^{2+}(\mathrm{aq})+2 \mathrm{PO}_{4}{ }^{3-}(\mathrm{aq})$

$$
3.2 \times 10^{-3} \mathrm{M} \quad 9.6 \times 10^{-3} \mathrm{M} \quad 6.4 \times 10^{-3} \mathrm{M}
$$

Practice Problems - Calculating the Concentrations of Ions in Solution

$$
\begin{aligned}
& \text { 1. }\left[\mathrm{HNO}_{3}\right]=\underline{0.20 \mathrm{~mol} \times \underline{0.035 \mathrm{E}}=0.0636 \mathrm{M}} \\
& 1 \mathrm{~L} \quad 0.1100 \mathrm{~L} \\
& {\left[\mathrm{Al}\left(\mathrm{NO}_{3}\right)_{3}\right]=\underline{0.15 \mathrm{~mol} \times \underline{0.075 \mathrm{E}}=0.102 \mathrm{M}}} \\
& 1 \mathrm{~L} \quad 0.1100 \mathrm{~L} \\
& \mathrm{HNO}_{3}(a q) \rightarrow \mathrm{H}^{+}(a q)+\mathrm{NO}_{3}^{-}(a q) \\
& 0.0636 \mathrm{M} \quad 0.0636 \mathrm{M} \quad 0.0636 \mathrm{M} \\
& \mathrm{Al}\left(\mathrm{NO}_{3}\right)_{3}(a q) \rightarrow \mathrm{Al}^{3+}(a q)+3 \mathrm{NO}_{3}{ }^{-}(a q) \\
& 0.102 \mathrm{M} \quad 0.102 \mathrm{M} \quad 0.306 \mathrm{M} \\
& {\left[\mathrm{H}^{+}\right]=0.064 \mathrm{M}} \\
& {\left[\mathrm{NO}_{3}{ }^{-}\right]=0.0636 \mathrm{M}+0.306 \mathrm{M}=0.37 \mathrm{M}} \\
& {\left[\mathrm{Al}^{3+}\right]=0.10 \mathrm{M}}
\end{aligned}
$$

2. $\left[\mathrm{H}_{2} \mathrm{SO}_{4}\right]=\underline{0.85 \mathrm{~mol}} \times \underline{0.0226 \mathrm{E}}=0.33 \mathrm{M}$
$1 \mathrm{~L} \quad 0.0580 \mathrm{~L}$
$\left[\mathrm{Na}_{2} \mathrm{SO}_{4}\right]=\frac{1.3 \mathrm{~mol}}{1 \mathrm{~L}} \times \frac{0.0354 \mathrm{~L}}{0.0580 \mathrm{~L}}=0.79 \mathrm{M}$
$\mathrm{H}_{2} \mathrm{SO}_{4}(a q) \rightarrow 2 \mathrm{H}^{+}(a q)+\mathrm{SO}_{4}{ }^{2-}(a q)$
$0.33 \mathrm{M} \quad 0.66 \mathrm{M} \quad 0.33 \mathrm{M}$
$\begin{array}{lc}\mathrm{Na}_{2} \mathrm{SO}_{4}(a q) \rightarrow & 2 \mathrm{Na}^{+}(a q) \\ 0.79 \mathrm{M} & +\quad \mathrm{SO}_{4}{ }^{2-}(a q) \\ 0.6 \mathrm{M} & 0.79 \mathrm{M}\end{array}$
$\left[\mathrm{Na}^{+}\right]=1.6 \mathrm{M}$
$\left[\mathrm{SO}_{4}{ }^{2-}\right]=0.33 \mathrm{M}+0.79 \mathrm{M}=1.1 \mathrm{M}$
$\left[\mathrm{H}^{+}\right]=0.66 \mathrm{M}$
```
3. \(\left[\mathrm{K}_{3} \mathrm{PO}_{4}\right]=\frac{0.10 \mathrm{~mol}}{1 \mathrm{E}} \times \frac{0.0500 \mathrm{E}}{0.0900 \mathrm{~L}}=0.0556 \mathrm{M}\)
    \(\left[\mathrm{K}_{2} \mathrm{C}_{2} \mathrm{O}_{4}\right]=\underline{0.20 \mathrm{~mol}} \times \underline{0.0400 \mathrm{E}}=0.0889 \mathrm{M}\)
            \(1 \mathrm{~L} \quad 0.0900 \mathrm{~L}\)
\(\mathrm{K}_{3} \mathrm{PO}_{4}(a q) \rightarrow 3 \mathrm{~K}^{+}(a q)+\mathrm{PO}_{4}{ }^{3-}(a q)\)
\(0.0556 \mathrm{M} \quad 0.167 \mathrm{M} \quad 0.0556 \mathrm{M}\)
\(\mathrm{K}_{2} \mathrm{C}_{2} \mathrm{O}_{4}(a q) \rightarrow 2 \mathrm{~K}^{+}(a q)+\mathrm{C}_{2} \mathrm{O}_{4}{ }^{2-}(a q)\)
\(0.0889 \mathrm{M} \quad 0.178 \mathrm{M} \quad 0.0889 \mathrm{M}\)
\(\left[\mathrm{PO}_{4}{ }^{3-}\right]=0.056 \mathrm{M}\)
\(\left[\mathrm{K}^{+}\right]=0.167 \mathrm{M}+0.178 \mathrm{M}=0.34 \mathrm{M}\)
\(\left[\mathrm{C}_{2} \mathrm{O}_{4}{ }^{2-}\right]=0.089 \mathrm{M}\)
```

4. $\left[\left(\mathrm{NH}_{4}\right)_{3} \mathrm{PO}_{4}\right]=\frac{2.3 \times 10^{-3} \mathrm{~mol}}{1 \mathrm{~L}} \times \frac{0.1000 \mathrm{E}}{0.1400 \mathrm{~L}}=1.6 \times 10^{-3} \mathrm{M}$
$\left[\left(\mathrm{NH}_{4}\right)_{2} \mathrm{~S}\right]=\frac{4.5 \times 10^{-2} \mathrm{~mol}}{1 \mathrm{~L}} \times \frac{0.0400 \mathrm{~L}}{0.1400 \mathrm{~L}}=1.3 \times 10^{-2} \mathrm{M}$
$\left(\mathrm{NH}_{4}\right)_{3} \mathrm{PO}_{4}(a q) \rightarrow 3 \mathrm{NH}_{4}{ }^{+}(a q)+\mathrm{PO}_{4}{ }^{3-}(a q)$
$1.6 \times 10^{-3} \mathrm{M} \quad 4.8 \times 10^{-3} \mathrm{M} \quad 1.6 \times 10^{-3} \mathrm{M}$
$\left(\mathrm{NH}_{4}\right)_{2} \mathrm{~S}(a q) \rightarrow 2 \mathrm{NH}_{4}^{+}(a q)+\mathrm{S}^{2-}(a q)$
$1.3 \times 10^{-2} \mathrm{M} \quad 2.6 \times 10^{-2} \mathrm{M} \quad 1.3 \times 10^{-2} \mathrm{M}$
$\left[\mathrm{PO}_{4}{ }^{3-}\right]=1.6 \times 10^{-3} \mathrm{M}$
$\left[\mathrm{NH}_{4}^{+}\right]=4.8 \times 10^{-3} \mathrm{M}+2.6 \times 10^{-2} \mathrm{M}=3.1 \times 10^{-2} \mathrm{M}$
$\left[\mathrm{S}^{2-}\right]=1.3 \times 10^{-2} \mathrm{M}$

## Quick Check

1. How can you tell from a substance's formula if it is ionic or molecular? Give two examples of an ionic compound.
Ionic Compounds contain a metal ion (or ammonium ion) and a negative ion. An example of anionic compound is NaCl or $\mathrm{NH}_{4} \mathrm{NO}_{3}$. A molecular compound contains only non-metals.
2. Sugar has the formula $\mathrm{C}_{12} \mathrm{H}_{22} \mathrm{O}_{11}$. Will a sugar solution conduct electricity? Explain. No, sugar is molecular. Ions are required for a solution to conduct electricity.
3. Explain why a 1.0 M solution of HCl will be a stronger electrolyte than a 1.0 M solution of $\mathrm{CH}_{3} \mathrm{COOH}$.
HCl is a strong acid, which means that it will dissociate into ions completely. $\mathrm{CH}_{3} \mathrm{COOH}$ is a weak acid so does not dissociate very much into ions.

### 7.3 Activity: Investigating Electrical Conductivity

In your diagrams, it should be demonstrated that:

- the dimmest light bulbs will be $\mathrm{C}_{12} \mathrm{H}_{22} \mathrm{O}_{11}$ and $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}$ because they are molecular
- only slightly brighter will be $\mathrm{NH}_{3}$ and $\mathrm{CH}_{3} \mathrm{COOH} . \mathrm{NH}_{3}$ is a weak base so does contain a few ions. $\mathrm{CH}_{3} \mathrm{COOH}$ is a weak acid and also contains a few ions.
- The next brightest bulb will be in the HCl . There is a total ion concentration of 1.6 M .
- The next brightest bulb will be the NaCl with a total ion concentration of 2.0 M .
- The brightest bulb will be in the $\mathrm{Na}_{2} \mathrm{CO}_{3}$ with a total ion concentration of 2.4 M .

## Results and Discussion

1. Which solutions were ionic? Covalent?

Ionic $=\mathrm{HCl}, \mathrm{NaOH}$ and $\mathrm{Na}_{2} \mathrm{CO}_{3}$. Covalent $=\mathrm{C}_{12} \mathrm{H}_{22} \mathrm{O}_{11}, \mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}, \mathrm{CH}_{3} \mathrm{COOH}$, and $\mathrm{NH}_{3}$
2. For each ionic solution, write a dissociation equation for the solute, and calculate the concentration of each ion present.
$\mathrm{HCl}(\mathrm{aq}) \rightarrow \mathrm{H}^{+}(\mathrm{aq})+\mathrm{Cl}^{-}(\mathrm{aq})$
$0.8 \mathrm{M} \quad 0.8 \mathrm{M} \quad 0.8 \mathrm{M}$
$\mathrm{NaCl}(\mathrm{aq}) \rightarrow \mathrm{Na}^{+}(\mathrm{aq})+\mathrm{Cl}^{-}(\mathrm{aq})$
$1.0 \mathrm{M} \quad 1.0 \mathrm{M} \quad 1.0 \mathrm{M}$
$\mathrm{Na}_{2} \mathrm{CO}_{3}(\mathrm{aq}) \rightarrow 2 \mathrm{Na}^{+}(\mathrm{aq})+\mathrm{CO}_{3}{ }^{2-}(\mathrm{aq})$
$0.8 \mathrm{M} \quad 1.6 \mathrm{M} \quad 0.8 \mathrm{M}$
3. Calculate the total ion concentration of each ionic solution by adding all of the ion concentrations together. Write this value under its corresponding diagram.
In HCl : [ions] $=1.6 \mathrm{M}$
In NaCl : [ions] $=2.0 \mathrm{M}$
In $\mathrm{Na}_{2} \mathrm{CO}_{3}$ : [ions] $=2.4 \mathrm{M}$
4. Rank the solutions in order from strongest electrolyte to weakest electrolyte. List the nonelectrolytes last. Use an equal sign ( $=$ ) for solutions that are about equally conductive. $\mathrm{Na}_{2} \mathrm{CO}_{3}>\mathrm{NaCl}>\mathrm{HCl}>\mathrm{CH}_{3} \mathrm{COOH}=\mathrm{NH}_{3}>\mathrm{C}_{12} \mathrm{H}_{22} \mathrm{O}_{11}=\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}$
5. Summarize the rules for determining if a solute will make a solution that is a good electrical conductor.
A good electrical conductor is one that contains ions. The higher the concentration of ions in solution, the greater its conductivity will be.

### 7.3 Review Questions

1a) $[\mathrm{HCl}]=\underline{0.55 \mathrm{~mol} \times 0.175 \mathrm{~L}}=0.48 \mathrm{M}$
$1 \mathrm{E} \quad 0.200 \mathrm{~L}$
b) $\left[\mathrm{Na}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}\right]=\frac{0.035 \mathrm{~mol}}{1 \mathrm{E}} \times \frac{0.0450 \mathrm{~L}}{0.1000 \mathrm{~L}}=0.016 \mathrm{M}$
c) $[\mathrm{NaOH}]=\underset{1 \mathrm{E}}{2.0 \mathrm{~mol}} \times \frac{0.1000 \mathrm{~L}}{0.0750} \mathrm{~L}=2.7 \mathrm{M}$
2. mol HCl required $=\frac{2.5 \mathrm{~mol}}{1 \mathrm{E}} \times 0.2500 \mathrm{E}=0.625 \mathrm{~mol} \mathrm{HCl}$
volume of stock solution $=0.625 \mathrm{~mol} x \quad \underline{\mathrm{~L}} \quad=0.10 \mathrm{~L}$
6.0 mol
3. When a solute dissolves in a solvent, the solvent molecules surround the solute particles. If the solvent is water, it is called hydration. If the solvent molecules are not water, it is call solvation.
4. A water molecule is polar. The oxygen atom on a water molecule has a negative dipole because the electrons in the bonds are more attracted to the oxygen atom. The negative dipole on the oxygen atom is attracted to the positive charge on the cation.
5. You will have 2 diagrams. Surrounding the $\mathrm{K}^{+}$ion, the water molecules are aligned such that the oxygen atoms are closest to the $\mathrm{K}^{+}$ion. For the $\mathrm{I}^{-}$ion, the water molecules are aligned such that the hydrogen atoms are closest.
6.
a) $\mathrm{FeCl}_{3}(a q) \rightarrow \mathrm{Fe}^{3+}(a q)+3 \mathrm{Cl}^{-}(a q)$
b) $\mathrm{MnHPO}_{4}(a q) \rightarrow \mathrm{Mn}^{2+}(a q)+\mathrm{HPO}_{4}{ }^{2-}(a q)$
c) $\mathrm{Zn}(\mathrm{SCN})_{2}(a q) \rightarrow \mathrm{Zn}^{2+}(a q)+2 \mathrm{SCN}^{-}(a q)$
d) $\mathrm{Al}_{2}\left(\mathrm{Cr}_{2} \mathrm{O}_{7}\right)_{3}(a q) \rightarrow 2 \mathrm{Al}^{3+}(a q)+3 \mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-}(a q)$
e) $\mathrm{Ag}_{2} \mathrm{C}_{2} \mathrm{O}_{4}(a q) \rightarrow 2 \mathrm{Ag}^{+}(a q)+\mathrm{C}_{2} \mathrm{O}_{4}{ }^{2-}(a q)$
f) $\mathrm{Fe}_{2}\left(\mathrm{SO}_{3}\right)_{3}(a q) \rightarrow 2 \mathrm{Fe}^{3+}(a q)+3 \mathrm{SO}_{3}{ }^{2-}(a q)$
g) $\mathrm{CrCrO}_{4}(a q) \rightarrow \mathrm{Cr}^{2+}(a q)+\mathrm{CrO}_{4}{ }^{2-}(a q)$
h) $\mathrm{NH}_{4} \mathrm{HC}_{2} \mathrm{O}_{4}(\mathrm{aq}) \rightarrow \mathrm{NH}_{4}{ }^{+}(a q)+\mathrm{HC}_{2} \mathrm{O}_{4}^{-}(\mathrm{aq})$
7. moles HCl from first solution: $\underline{0.60 \mathrm{~mol}} \times 0.2500 \mathrm{~L}=0.15 \mathrm{~mol}$ 1 L
moles HCl from second solution $=\underline{1.0 \mathrm{~mol} \times 0.3000 \mathrm{E}=0.30 \mathrm{~mol}}$
1 L
total moles $\mathrm{HCl}=0.15 \mathrm{~mol}+0.30 \mathrm{~mol}=0.45 \mathrm{~mol}$
total volume $=250.0 \mathrm{~mL}+300.0 \mathrm{~mL}=550.0 \mathrm{~mL}=0.5500 \mathrm{~L}$
$[\mathrm{HCl}]=0.45 \mathrm{~mol} / 0.5500 \mathrm{~L}=0.82 \mathrm{M}$
8. a) $\mathrm{CuCl}_{2}(\mathrm{aq}) \rightarrow \mathrm{Cu}^{2+}(\mathrm{aq})+2 \mathrm{Cl}^{-}(\mathrm{aq})$
$0.20 \mathrm{M} \quad 0.20 \mathrm{M} \quad 0.40 \mathrm{M}$
b) $\mathrm{Li}_{2} \mathrm{C}_{2} \mathrm{O}_{4}(\mathrm{aq}) \rightarrow 2 \mathrm{Li}^{+}(\mathrm{aq})+\mathrm{C}_{2} \mathrm{O}_{4}{ }^{2-}(\mathrm{aq})$ $1.5 \mathrm{M} \quad 3.0 \mathrm{M} \quad 1.5 \mathrm{M}$
c) $\mathrm{HNO}_{3}(\mathrm{aq}) \rightarrow \mathrm{H}^{+}(\mathrm{aq})+\mathrm{NO}_{3}{ }^{-}(\mathrm{aq})$

$$
\begin{array}{lll}
6.0 \mathrm{M} & 6.0 \mathrm{M} & 6.0 \mathrm{M}
\end{array}
$$

d) $\mathrm{Mg}\left(\mathrm{MnO}_{4}\right)_{2}(\mathrm{aq}) \rightarrow \mathrm{Mg}^{2+}(\mathrm{aq})+2 \mathrm{MnO}_{4}^{-}(\mathrm{aq})$
$1.4 \times 10^{-3} \mathrm{M} \quad 1.4 \times 10^{-3} \mathrm{M} \quad 2.8 \times 10^{-3} \mathrm{M}$
e) $\left[\mathrm{Al}\left(\mathrm{NO}_{3}\right)_{3}\right]=\underline{0.25 \mathrm{~mol} \times \underline{0.0185 \mathrm{E}}=0.11 \mathrm{M}}$

10. The $\mathrm{NO}_{3}{ }^{-}$ions move to the positive electrode. The $\mathrm{K}^{+}$ions move to the negative electrode. This is a strong electrolyte because it contains ions.
11. Strong acids dissociate completely to form ions. They are $\mathrm{HCl}, \mathrm{HBr}, \mathrm{HI}, \mathrm{HNO}_{3}, \mathrm{H}_{2} \mathrm{SO}_{4}$ and $\mathrm{HClO}_{4}$.
12. Place the conductivity apparatus in each solution. The $\mathrm{HNO}_{3}$ solution will be a strong conductor because it is ionic. The $\mathrm{C}_{12} \mathrm{H}_{22} \mathrm{O}_{11}$ solution will be a poor conductor because it is molecular.
13. a) strong electrolyte
b) non-electrolyte
c) weak electrolyte
d) strong electrolyte
e) non- electrolyte
f) weak electrolyte
14. Disagree. You can have a sugar solution of high concentration, but it is still molecular, and contains no ions. It will not conduct electricity. Strong electrolytes contain many ions.

## Section 7.4

Warm Up
There are many different ways to classify these substances. Many students will group according to ionic or molecular. Other students may group as acids, bases, salts and molecular.

## Quick Check

1. Balance the following neutralization equation:
$1 \mathrm{H}_{2} \mathrm{SO}_{4}(a q)+2 \mathrm{NaOH}(a q) \rightarrow 2 \mathrm{H}_{2} \mathrm{O}(l)+1 \mathrm{Na}_{2} \mathrm{SO}_{4}(a q)$
2. Write the balanced equation for the reaction between aluminum hydroxide and hydrobromic acid to form aluminum bromide and water.
$3 \mathrm{HBr}(a q)+\mathrm{Al}(\mathrm{OH})_{3}(a q) \rightarrow \mathrm{AlBr}_{3}(a q)+3 \mathrm{H}_{2} \mathrm{O}(l)$
3. Complete and balance the following equation:
$2 \mathrm{NH}_{4} \mathrm{OH}+\mathrm{H}_{2} \mathrm{SO}_{4} \rightarrow\left(\mathrm{NH}_{4}\right)_{2} \mathrm{SO}_{4}+2 \mathrm{H}_{2} \mathrm{O}$ (1)
4. Write the formula for the acid and base that will react to give the salt $\mathrm{K}_{2} \mathrm{CO}_{3}$ and water. Acid $=$ $\mathrm{H}_{2} \mathrm{CO}_{3}$ and base $=\mathrm{KOH}$

## Practice Problems - Simple Titration Calculations

1. mole $\mathrm{NaOH}=0.30 \mathrm{~mol} \times 0.01562 \mathrm{~L}=4.69 \times 10^{-3} \mathrm{~mol} \mathrm{NaOH}$

1L

$$
\text { mole } \mathrm{HCl}=4.69 \times 10^{-3} \mathrm{~mol} \mathrm{NaOH} \times \frac{1 \mathrm{~mol} \mathrm{HCl}}{1 \mathrm{~mol} \mathrm{NaOH}}=4.69 \times 10^{-3} \mathrm{~mol} \mathrm{HCl}
$$

$$
[\mathrm{HCl}]=\underbrace{4.0 .19 \mathrm{M}}_{0.69 \times 10^{-3} \mathrm{~mol} \mathrm{HCl}}
$$

$$
0.02500 \mathrm{~L}
$$

2. mole $\mathrm{H}_{2} \mathrm{SO}_{4}=\underline{0.20 \mathrm{~mol} \times 0.02425 \mathrm{E}=4.85 \times 10^{-3} \mathrm{~mol} \mathrm{H}_{2} \mathrm{SO}_{4}}$

1L
mole $\mathrm{NaOH}=4.85 \times 10^{-3} \mathrm{~mol} \mathrm{H}_{2} \mathrm{SO}_{4} \times 2 \mathrm{~mol} \mathrm{NaOH}=9.70 \times 10^{-3} \mathrm{~mol} \mathrm{NaOH}$ $1 \mathrm{~mol} \mathrm{H}_{2} \mathrm{SO}_{4}$

$$
[\mathrm{NaOH}]=\frac{9.70 \times 10^{-3} \mathrm{~mol} \mathrm{NaOH}}{0.01000 \mathrm{~L}}=0.97 \mathrm{M}
$$

3. mole $\operatorname{Sr}(\mathrm{OH})_{2}=\frac{0.015 \mathrm{~mol}}{1 \mathrm{~L}} \times 0.02268 \mathrm{~L}=3.40 \times 10^{-4} \mathrm{~mol} \mathrm{Sr}(\mathrm{OH})_{2}$

$$
\begin{aligned}
& \text { mole } \mathrm{HNO}_{3}=3.40 \times 10^{-4} \mathrm{~mol} \mathrm{Sr}(\mathrm{OH})_{z} \times \frac{2 \mathrm{~mol} \mathrm{NaOH}}{1 \mathrm{~mol} \mathrm{Sr}(\mathrm{OH})_{z}}=6.80 \times 10^{-4} \mathrm{~mol} \mathrm{HNO}_{3} \\
& {\left[\mathrm{HNO}_{3}\right]=\frac{6.80 \times 10^{-4} \mathrm{~mol} \mathrm{HNO}_{3}}{0.00500 \mathrm{~L}}=0.14 \mathrm{M}}
\end{aligned}
$$

4. $\mathrm{mole} \mathrm{NaOH}=\underline{0.12 \mathrm{~mol}} \times 0.01000 \mathrm{E}=1.2 \times 10^{-3} \mathrm{~mol} \mathrm{NaOH}$

1E
$\mathrm{mol} \mathrm{H} \mathrm{H}_{2} \mathrm{O}_{4}=1.2 \times 10^{-3} \mathrm{~mol} \mathrm{NaOH} \times 1 \mathrm{~mol} \mathrm{H}_{2} \underline{\mathrm{C}}_{2} \underline{\mathrm{O}}_{4}=6.0 \times 10^{-4} \mathrm{~mol}$ 2 mol NaOH
volume $\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}=6.0 \times 10^{-4} \mathrm{~mol} \mathrm{H}_{2} \mathrm{E}_{2} \mathrm{O}_{4} \times \quad \underline{1 \mathrm{~L}} \quad=1.2 \times 10^{-3} \mathrm{~L}$ $0.50 \mathrm{~mol} \mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}$

## Quick Check

1. How is a pipette is different than a burette?A pipette is used to deliver a specific volume of solution. The solution is suctioned up into the pipette. A burette is used to gradually add a volume of solution. It has a valve that dispenses solution.
2. What solution goes into the burette? Usually the standardized solution.
3. Which piece of glassware is the indicator added to? The Erlenmeyer flask.
4. What is "equivalent" at the equivalence point? Moles of $\mathrm{H}^{+}$and moles of $\mathrm{OH}^{-}$.
7.4 Activity: Titrating $\mathrm{CH}_{3} \mathrm{COOH}$ with NaOH

Results and Discussion

1. $\mathrm{CH}_{3} \mathrm{COOH}+\mathrm{NaOH} \rightarrow \mathrm{NaCH}_{3} \mathrm{COO}+\mathrm{H}_{2} \mathrm{O}$
2. Colourless
3. When a small amount of NaOH is added, it is neutralized by the $\mathrm{CH}_{3} \mathrm{COOH}$. There is an excess of $\mathrm{CH}_{3} \mathrm{COOH}$ so the indicator remains colourless.
4. $12.30 \mathrm{~mL}-0.50 \mathrm{~mL}=11.80 \mathrm{~mL}$
5. At the endpoint the indicator changes colour because the $\mathrm{CH}_{3} \mathrm{COOH}$ has been completely neutralized by the added NaOH and there is now an excess of NaOH in the flask.
6. Trial \#1: $12.31 \mathrm{~mL}-0.50 \mathrm{~mL}=11.81 \mathrm{~mL}$

Trial \#2: $23.75 \mathrm{~mL}-12.31 \mathrm{~mL}=11.44 \mathrm{~mL}$
Trial \#3: $35.22 \mathrm{~mL}-23.70 \mathrm{~mL}=11.52 \mathrm{~mL}$
Average volume $\mathrm{NaOH}=(11.44 \mathrm{~mL}+11.52 \mathrm{~mL}) / 2=11.48 \mathrm{~mL}$
7. $\mathrm{mol} \mathrm{NaOH}=\underline{0.15 \mathrm{~mol} \times 0.01148 \mathrm{E}=1.72 \times 10^{-3} \mathrm{~mol} \mathrm{NaOH}}$ 1 L
8. $\mathrm{mol} \mathrm{CH}_{3} \mathrm{COOH}=1.72 \times 10^{-3} \mathrm{~mol} \mathrm{NaOH} \times 1 \mathrm{~mol} \mathrm{CH}_{3} \mathrm{COOH}=1.72 \times 10^{-3} \mathrm{~mol}$

$$
1 \mathrm{~mol} \mathrm{NaOH}
$$

9. $\left[\mathrm{CH}_{3} \mathrm{COOH}\right]=\frac{1.72 \times 10^{-3}}{0.0100 \mathrm{~L}} \underline{\mathrm{~mol} \mathrm{CH}_{3}} \underline{\mathrm{COOH}}=0.17 \mathrm{M}$

## Review Questions

1. Acid begins with H or ends in -COOH . Ex. HCl or $\mathrm{CH}_{3} \mathrm{COOH}$. A base contains hydroxide. An example is NaOH .
2. (a) $\mathrm{HI}+\mathrm{LiOH} \rightarrow \mathrm{LiI}+\mathrm{H}_{2} \mathrm{O}$
(b) $\mathrm{Ca}(\mathrm{OH})_{2}+2 \mathrm{HNO}_{3} \rightarrow \mathrm{Ca}\left(\mathrm{NO}_{3}\right)_{2}+2 \mathrm{H}_{2} \mathrm{O}$
(c) $\mathrm{CH}_{3} \mathrm{COOH}+\mathrm{NH}_{4} \mathrm{OH} \rightarrow \mathrm{NH}_{4} \mathrm{CH}_{3} \mathrm{COO}+\mathrm{H}_{2} \mathrm{O}$
(d) $\mathrm{H}_{2} \mathrm{SO}_{4}+2 \mathrm{KOH} \rightarrow \mathrm{K}_{2} \mathrm{SO}_{4}+2 \mathrm{H}_{2} \mathrm{O}$
3. In the diagram, the $\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}$ is in the burette, and the NaOH is in the flask. A pipette is used to measure out a specific volume of NaOH into the Erlenmeyer flask.
The solution will be pink at the beginning of the titration because the Erlenmeyer contains the base NaOH . At the endpoint, the solution will be colourless when all of the NaOH has been neutralized.
4. Standardized - a solution whose concentration is known.

Equivalence point - the point in the titration where moles $\mathrm{H}^{+}=$moles $\mathrm{OH}-$.
Endpoint - the point in the titration where the indicator changes colour.
5. A student titrated 10.00 mL HCl with $0.050 \mathrm{M} \mathrm{Sr}(\mathrm{OH})_{2}$. The table below shows the data collected. Calculate the $[\mathrm{HCl}]$.

| Molarity of <br> $\mathbf{S r}(\mathbf{O H})_{2}=\mathbf{0 . 0 5 0 ~ M}$ | Trial \#1 | Trial \#2 | Trial \#3 |
| :--- | :--- | :--- | :--- |
| Initial burette reading <br> $(\mathrm{mL})$ | 0.00 | 16.05 | 32.93 |
| Final burette reading <br> $(\mathrm{mL})$ | 16.05 | 32.93 | 49.68 |
| Volume of $\operatorname{Sr}(\mathrm{OH})_{2}$ <br> added $(\mathrm{mL})$ | 16.05 | 16.88 | 16.75 |
| Average volume <br> $\mathrm{Sr}(\mathrm{OH})_{2}(\mathrm{~mL})$ | 16.82 |  |  |

mole $\operatorname{Sr}(\mathrm{OH})_{2}=\underline{0.050 \mathrm{~mol} \times 0.01682 \mathrm{~L}=8.41 \times 10^{-4} \mathrm{~mol} \mathrm{Sr}(\mathrm{OH})_{2}}$

1L
mole $\mathrm{HCl}=8.41 \times 10^{-4} \mathrm{~mol} \mathrm{Sr}(\mathrm{OH})_{z} \times 2 \mathrm{~mol} \mathrm{HCl}=1.68 \times 10^{-3} \mathrm{~mol} \mathrm{HCl}$ $1 \mathrm{~mol} \mathrm{Sr}(\mathrm{OH})_{z}$
$[\mathrm{HCl}]=\frac{1.68 \times 10^{-3} \mathrm{~mol} \mathrm{HCl}}{0.01000 \mathrm{~L}}=0.17 \mathrm{M}$
6. $\mathrm{mol} \mathrm{H}_{2} \mathrm{CO}_{3}=0.20 \mathrm{~mol} \times 0.02500 \mathrm{~L}=0.0050 \mathrm{~mol} \mathrm{H}_{2} \mathrm{CO}_{3}$ $\mathrm{mol} \mathrm{NaOH}=0.0050 \mathrm{~mol} \mathrm{H}_{2} \mathrm{CO}_{3} \times \underline{2 \mathrm{~mol} \mathrm{NaOH}}=0.010 \mathrm{~mol} \mathrm{NaOH}$ $1 \mathrm{~mol} \mathrm{H}_{2} \mathrm{CO}_{3}$
volume $\mathrm{NaOH}=0.010 \mathrm{~mol} \mathrm{NaOH} \times \frac{1 \mathrm{~L}}{0.50 \mathrm{~mol} \mathrm{NaOH}}=0.020 \mathrm{~L} \mathrm{NaOH}$
7. $\mathrm{mole} \mathrm{NaOH}=\underline{0.50 \mathrm{~mol} \times 0.01820 \mathrm{E}=9.1 \times 10^{-3} \mathrm{~mol} \mathrm{NaOH}}$

1L
mole $\mathrm{CH}_{3} \mathrm{COOH}=9.1 \times 10^{-3} \mathrm{~mol} \mathrm{NaOH} \times \underline{1 \mathrm{~mol} \mathrm{HCl}}=9.1 \times 10^{-3} \mathrm{~mol} \mathrm{CH}_{3} \mathrm{COOH}$ 1 mol NaOH
$\left[\mathrm{CH}_{3} \mathrm{COOH}\right]=\frac{9.1 \times 10^{-3} \mathrm{~mol} \mathrm{CH}_{3} \mathrm{COOH}}{0.01000 \mathrm{~L}}=0.91 \mathrm{M}$
8. $\left[\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}\right]=\frac{0.18 \mathrm{~g}}{0.25000 \mathrm{~L}}$ x $\frac{1 \mathrm{~mol}}{126 \mathrm{~g}}=5.7 \times 10^{-3} \mathrm{M}$ $\mathrm{mol} \mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}=\frac{5.7 \times 10^{-3} \mathrm{~mol}}{1 \mathrm{~L}} \times 0.02500 \mathrm{E}=1.4 \times 10^{-4} \mathrm{~mol} \mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}$
$\mathrm{mol} \mathrm{NaOH}=1.4 \times 10^{-4} \mathrm{~mol} \mathrm{H}_{z} \mathrm{E}_{z} \Theta_{4} \times 2 \mathrm{~mol} \mathrm{NaOH}=2.9 \times 10^{-4} \mathrm{~mol} \mathrm{NaOH}$ $1 \mathrm{~mol} \mathrm{H}_{z} \mathrm{C}_{z} \mathrm{O}_{4}$
$[\mathrm{NaOH}]=\frac{2.9 \times 10^{-4} \mathrm{~mol}}{0.01525 \mathrm{~L}}=1.9 \times 10^{-2} \mathrm{M}$
9. $\mathrm{mol} \mathrm{NaOH}=\underline{0.10 \mathrm{~mol}} \times 0.01830 \mathrm{E}=1.83 \times 10^{-3} \mathrm{~mol} \mathrm{NaOH}$

1L
$\mathrm{mol} \mathrm{C}_{9} \mathrm{H}_{8} \mathrm{O}_{4}=1.83 \times 10^{-3} \mathrm{~mol} \mathrm{NaOH} \times \underline{1 \mathrm{~mol} \mathrm{C}_{9}} \mathrm{H}_{8} \mathrm{O}_{4}=1.83 \times 10^{-3} \mathrm{~mol} \mathrm{C}_{9} \mathrm{H}_{8} \mathrm{O}_{4}$ 1 mol NaOH
mass $\mathrm{C}_{9} \mathrm{H}_{8} \mathrm{O}_{4}=1.83 \times 10^{-3} \mathrm{molC}_{9} \mathrm{H}_{8} \mathrm{O}_{4} \times \frac{180 \mathrm{~g}}{1 \mathrm{~mol}_{9} \mathrm{H}_{8} \mathrm{O}_{4}}=0.329 \mathrm{~g}$
$\% \mathrm{C}_{9} \mathrm{H}_{8} \mathrm{O}_{4}=0.329 \mathrm{~g} / 0.50 \mathrm{~g} \mathrm{x} 100 \%=66 \%$
10. $\mathrm{mol} \mathrm{HCl}=\underline{0.10 \mathrm{~mol} \times 0.00725 \mathrm{~L}=7.25 \times 10^{-4} \mathrm{~mol} \mathrm{HCl}}$

1 L
$\mathrm{mol} \mathrm{Ca}(\mathrm{OH})_{2}=7.25 \times 10^{-4} \mathrm{~mol} \mathrm{HCl} \times \underline{1 \mathrm{~mol} \mathrm{Ca}(\mathrm{OH})_{2}}=3.63 \times 10^{-4} \mathrm{~mol} \mathrm{Ca}(\mathrm{OH})_{2}$ 2 mol HCl
$\operatorname{mass} \mathrm{Ca}(\mathrm{OH})_{2}=3.63 \times 10^{-4} \mathrm{~mol} \mathrm{Ca}(\mathrm{OH})_{z} \times 74.1 \mathrm{~g} \quad=0.027 \mathrm{~g}$

## $1 \mathrm{~mol} \mathrm{Ca}(\mathrm{OH})_{z}$

```
11. Volume NaOH added:
trial \(1=15.25 \mathrm{~mL}\)
trial \(2=15.22 \mathrm{~mL}\)
trial \(3=15.40 \mathrm{~mL}\)
average volume \(=(15.25+15.22) / 2=15.24 \mathrm{~mL} \mathrm{NaOH}\)
\(\mathrm{mol} \mathrm{NaOH}=\underline{0.100 \mathrm{~mol}} \times 0.01524 \mathrm{~L}=1.52 \times 10^{-3} \mathrm{~mol} \mathrm{NaOH}\)
1 士
\(\mathrm{mol} \mathrm{HA}=1.52 \times 10^{-3} \mathrm{~mol} \mathrm{NaOH} \times 1 \mathrm{~mol} \mathrm{HA}=1.52 \times 10^{-3} \mathrm{~mol} \mathrm{HA}\)
1 mol NaOH
