

Bioenergy is a form of renewable energy derived from biomass to generate heat, electricity, renewable products, and liquid fuels for transportation.

In 1908, Ford Motor Company's first car used ethanol made from corn.

Today, race cars can run on ethanol made from biomass.

# Make the Biofuels Connection

Draw a line connecting the feedstock with its name.

9

## **Biomass Crossword Puzzle**

### 2. A fuel made from biomass

ACROSS

- 3. Biomass is \_\_\_\_\_ because it can be regrown
- 4. What can be powered by biofuels?
- 5. Energy produced from plant-based materials
- 6. Crop waste that can be used to make biofuel
- 7. Rolled up corn stover
- 8. Seasonal collection of crops
- 9. Where biomass feedstocks can be grown

See answers on solutions page

# Some Words to Learn

**Harvesting**: Only an appropriate amount of biomass is removed to ensure the process is sustainable and the soil health is maintained.

**Corn Stover:** Stalks, leaves, and cobs that remain after removal of corn.

**Bale:** Harvested corn stover, either round or square shaped.

**Cellulose:** Main component of plant cell walls.

**Algae:** Plantlike small aquatic organisms that convert sunlight into energy – the green stuff in ponds or seaweeds in oceans or lakes. Most algae grow in freshwater or seawater.

**Biodiesel:** A renewable fuel that can be made from vegetable oils, animal fats, or recycled restaurant grease. For example, lipids, or oils, can be extracted from the walls of the algae cells and turned into biodiesel fuel.

**Municipal Solid Waste (MSW):** Trash or garbage, such as everyday items we use and then throw away, can be converted to a clean gas by using heat. With chemical processes, gas is turned into liquid alcohol fuels.
