23303	Initial document release for Version 7.2
23304	Added CLI Voice Changes section.

Documentation Feedback

AudioCodes continually strives to produce high quality documentation. If you have any comments (suggestions or errors) regarding this document, please fill out the Documentation Feedback form on our Web site at <http://www.audiocodes.com/downloads>.

1 Introduction

This document describes the following important information for MSBR users when upgrading to Version 7.2:

- **CLI Changes:** Most of the changes to the CLI affect the Voice configuration. Only a few of the CLI changes affect the Data configuration. These changes are described in this document.
- **Old CLI Script:** "show running-config" output that has been copied from Version 6.8 can be inserted into 7.2. Also commands copied from Version 6.8 will work if inserted using the full command text string. For Example: "show" will work, and "sh ..." will not work.
- **Autocomplete:** Entering CLI commands using autocomplete i.e. using the tab key, will not work for existing Version 6.8 commands whose path has been changed in Version 7.2 (as shown in Section 4.2).
- **Dual Network Mode:** When upgrade is performed from Version 6.8 to Version 7.2 and the existing Version 6.8 platform is configured to work in Dual Network mode, the Dual Network mode configuration remains. New MSBR devices with a clean installation of Version 7.2 are by default configured with a Single Network mode.

In addition to the above, this document also includes instructions on how to upgrade device firmware to Version 7.2 and also includes example configuration output for both Version 6.8 and Version 7.2.

This page is intentionally left blank.

2 Hardware and Software Requirements

This chapter describes the hardware and software requirements for running MSBR Version 7.2 firmware.

2.1 Hardware Requirements

The following hardware platforms are supported for MSBR Version 7.2:

- Mediant 500L MSBR
- Mediant 500 MSBR
- Mediant 800 MSBR

2.2 Software Requirements

- The software can be loaded to the MSBR using FTP, TFTP, HTTP or HTTPS. For best results, it is recommended to use HTTP or HTTPS servers.
- Upgrade to Version 7.2 needs to be performed from at least Version 6.80.286.002. If the MSBR version is lower than Version 6.80.286.002, the MSBR first needs to be upgraded to this version.

This page is intentionally left blank.

3 Upgrade Procedure

The upgrade can be performed using the CLI, Web GUI or by using Management Software using CWMP protocol.

➤ **To upgrade using the CLI, do one of the following:**

- Copy firmware from an HTTP server using IP:

```
copy firmware from
http://10.199.0.100/MSBR_SIP_F7.20A.140.512.cmp
```

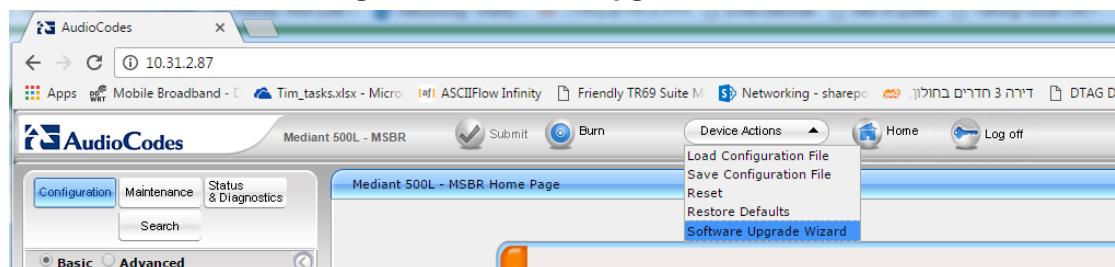

- Copy firmware using an HTTPS server using a DNS name

```
copy firmware from
https://someserver/MSBR_SIP_F7.20A.140.512.cmp
```

➤ **To upgrade using the Web:**

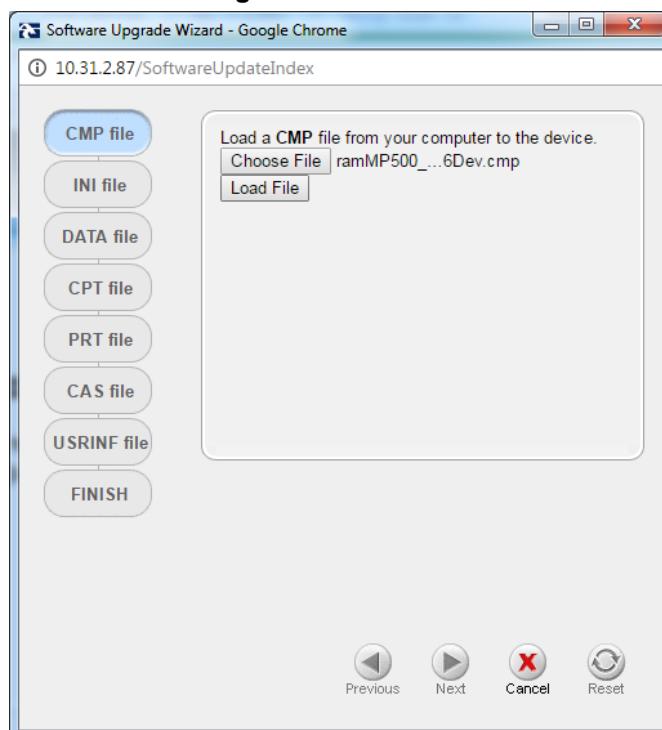

1. From the Device Actions drop-down list, select **Software Upgrade Wizard**:

Figure 3-1: Software Upgrade Wizard

2. Choose a file to load and click the **Load File** button.

Figure 3-2: Load File

3. When the file has finished loading, click the **Reset** button.

Following the upgrade, specific commands will be located in different paths. If management software is used, for example a CWMP server, make sure that you have copied a Version 7.2.150 or later configuration file to the Management server. It is recommended to download the new configuration to the Management Software after the MSBR have been upgraded.

It is possible to manually download the configuration from the device using the copy command. For example:

```
copy cli-script to tftp://10.51.13.5/config.cli
```

This command copies the configuration in the form of a CLI script (this is displayed when the Show Run command is used) to the TFTP server address e.g. 10.51.13.5 to the file config.cli. You can also use a FTP, HTTP, or HTTPS server for this command.

3.1 Single Network Mode

After you have upgraded, it is recommended to configure your device for the Single Network mode. In this mode of operation, the Voice application runs on the MSBR as a linked application, and therefore the network configuration is not required to be configured on the Voice part. For more information about switching to Single Network mode, refer to document *MSBR Simplifying Network CLI Configuration Note Ver. 7.2*.

4 Data CLI Changes

This chapter summarizes the changes to the CLI interface for Version 7.2.

4.1 DSL Operation Mode

All subcommands from the DSL interface were removed because the DSL operation mode was changed. From this version onwards, users cannot configure the specific DSL operation mode ADSL or VDSL. These operation modes will be automatically selected by the device through sensing the signals on the DSL line.

4.2 Command Path Changes

In Version 7.2, the location for specific commands has been changed in the command tree.

Example: Binding an application configuration to an interface.

- Version 6.8:

```
# configure system
(config-system)# bind interface gigabitethernet 0/0 voip
```

- Version 7.2:

```
# configure network
(config-network)# bind interface gigabitethernet 0/0 voip
```

The following table describes the changes in Configuration commands:

Table 4-1: Configuration Command Path Changes

Command	Description	Command Path	
		Version 6.8	Version 7.2
bind	Binds application to interface.	config-system	config-network
interface	Configures OSN interface.	config-system	config-network
hostname	Sets product hostname.	config-system	config-network
nqm	Configures Network Quality Monitoring.	config-system	config-network
tftp-server	Internal TFTP server	config-system	config-network
logging	Logging configuration	config-system	config-troubleshoot
access-list	Network access list.	config-voip	config-network
dhcp-server	DHCP server configuration.	config-voip (was previously dhcp)	config-network
dns	DNS configuration.	config-voip	config-network

The following table describes these changes in Show commands:

Table 4-2: Show Commands Changes

Command	Description	Version 6.8 Path	Version 7.2 Path
show version	Displays software version.	Show system version	Show version
show system date or show system time	Displays current system date or time.	Show system date Or Show system time	show system clock
show system nqm	Displays networking information of VoIP applications.	Show system nqm	Show nqm

5 Data CLI Changes Examples

This chapter shows comparison example running configurations for Version 6.8 and Version 7.2.150.

5.1 Version 6.8 Configuration

6 CLI Voice Changes

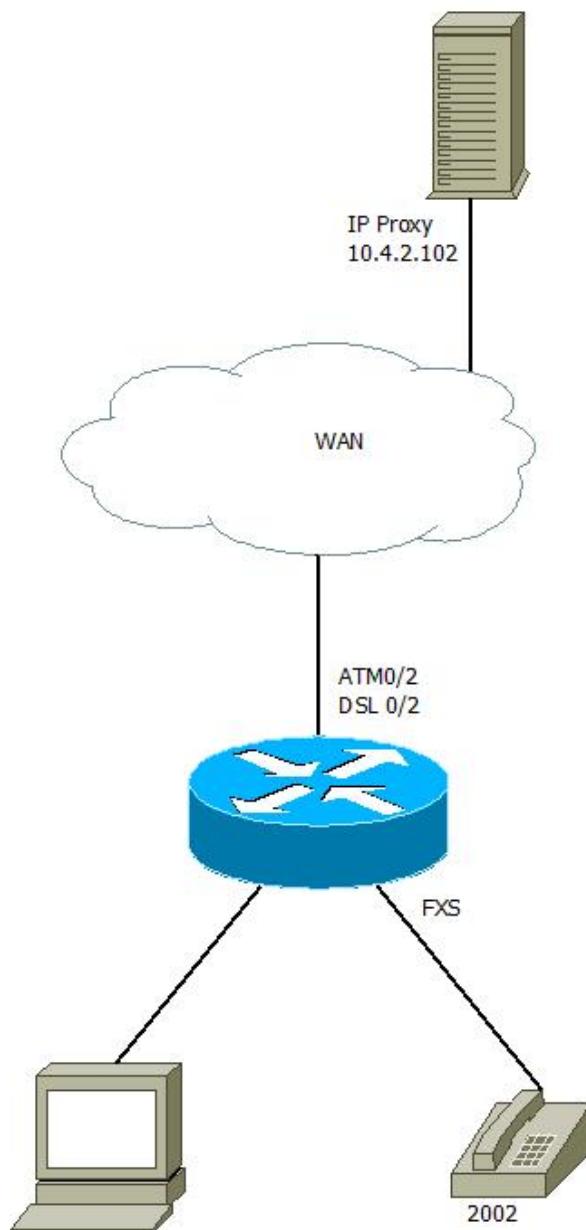

Most of CLI changes are in the Voice section. To keep the new version backward compatible, the old CLI commands can be pasted to the MSBR. However the TAB key will not complete partially written commands and the '?' wont display the old CLI commands.

The following section compares by sections, the changes in the CLI Voice commands. It is also recommended to review the *CLI Configuration Guide* to learn the new Voice commands.

6.1 Simple Voice Configuration Changes Example

In this configuration, the following topology is configured:

Figure 6-1: Configured Topology

In the following table, the left column lists Version 6.8 commands, and the right column lists the equivalent command in Version 7.2. Both configurations achieve the same goal. The table is arranged in the order of the Version 7.2 CLI script, while the Version 6.8 commands is in order as it appears in the output of the "show run" command.

Version 6.8	Version 7.2
