Description

These molded case Navy circuit breakers provide both overload protection for conductors and short circuit protection for all circuit elements such as conductors, motors and starters. They also serve as manual disconnecting means as well as circuit protectors.

All Eaton's Cutler-Hammer® circuit breakers in this Product Guide meet applicable Navy specifications for "hi-shock." These manually operated breakers are rated from 5 to 4,000 amperes with interrupting ratings from 1,500 to 150,000 amperes. (See "Selector Guide" on **Page 2** for ratings and Navy specifications.)

Design Features

Cutler-Hammer Navy circuit breakers retain all the features of standard commercial type AB DE-ION breakers listed on **Page 4** under "standard features." Built to Navy specifications, they incorporate the following Navy requirements:

Specific Navy Features

- **Qualified Products** — All Navy circuit breakers undergo rigorous qualification testing to MIL-C-17361 and are listed on the associated Qualified Products List issued by the federal government. (ACB's per MIL-C-17587, ALB-1's per MIL-C-17588, and AQB's per MIL-C-17361.)

- **Shock-Resistant Molded Case** — Housing consists of rear base section and cover molded of glass alkyd material. This material, reinforced glass filled thermosetting plastic, has very high mechanical strength (shock and impact resistance), is both fire and moisture-resistant and provides excellent dielectric characteristics.
- **Anti-Shock Device** — Inertia weight over center pole holds trip bar in latched position under shock conditions but does not prevent thermal or magnetic trip units from functioning on overload and short circuits.
- **Shock and Vibration Resistant** — Navy circuit breakers are all tested to MIL-S-901 for Hi Impact Shock, and MIL-STD-167 for Mechanical Vibration. This test ensures that the circuit breakers will operate properly in the Naval shipboard environment.
- **EMI Resistant** — All Navy circuit breakers with Electronic Trip Units (ETUs) are tested for electromagnetic immunity and emissions per MIL-STD-461 and -462 to eliminate interference from radiated or conducted EMI.
- **50°C Calibrated** — Thermal-magnetic circuit breakers are calibrated for 50°C ambient temperature. The calibration of circuit breakers with ETUs are inherently unaffected by ambient temperature.

- **Interchangeable Trip Units** — All thermal and magnetic trip units in AQB circuit breakers are encased in sealed, self-contained units that are interchangeable with other trip units of different ampere ratings within the same frame size.

Note:

Interchangeable trip units are not available in the A101, ALB-1, A50 or A51.

- **Plug-in Connectors** — All Navy circuit breakers are designed for optional molded plug-in bases in a variety of styles. Smaller breakers (ALB-1, A50 and A51) must be used with the associated bases. Other MCCBs can be converted for direct cable or plug-in mount. Plug in bases are available in a variety of styles depending upon the circuit breaker type. See the specific circuit breaker style for available mounting bases and outline drawings.

Note:

All A101, A50 or A51 breakers have plug-in connectors. Front or rear connectors determined by mounting base selected.

ALB breakers have a clamp terminal on the line end to receive panelboard bus stab projections.

- **Interrupting Ratings to 150 kA** — Navy circuit breakers are available with interrupting ratings up to 150 kA, many using modern fuseless current-limiting technology. Circuit breakers rated 100 ampere and below must be used with associated current limiting fuses to achieve high interrupting capacity.

General Information

Standard Features

- **Corrosion-Resistant** — All parts are specially treated to resist corrosion. Fungus-moisture resistant treatments for severe atmospheres are available as modifications.
- **Positive Position Indication** — Position of handle always indicates ON, OFF, or TRIPPED.
- **Free-Bearing Surfaces** — Dissimilar metals are used to prevent bearing wear and eliminate sticking.
- **DE-ION® Arc Quenchers** — This Eaton development consists of a series of grid plates mounted in parallel between supports of insulating material. The slots in the steel plates are directly over the contacts and draw the arc from the moving contact up into the divided chamber where it is confined, divided, and extinguished.
- **Silver Alloy Contacts** — Special silver alloy contacts prevent sticking and welding, increase contact life and insure low resistance when carrying full-rated load.
- **Quick-Make, Quick-Break Over Center Toggle Mechanism** — Provides quick, positive action in opening and closing of circuits, prevents “teasing” of contacts and reduces contact wear.
- **Complete Interpole Barriers** — Ensure against internal flashovers when faults occur.
- **Common Trip** — Two and three-pole units have insulated common trip bar that opens all poles simultaneously when an overload occurs on any one, thus eliminating possibility of single-phasing.
- **Tested Accuracy** — All tripping members have ground and polished latch surfaces heat treated to prevent galling or later distortion. All parts are tested in temperature-controlled atmosphere to ensure correct calibration and perfect mating. Each breaker is thoroughly tested.
- **Factory Sealed** — Smaller breakers are factory sealed to prevent tampering with calibration. Interchangeable trip units are individually sealed.

Application

Designed primarily for circuit protection, Cutler-Hammer Navy circuit breakers are used in lighting and power panels, switchboards, distribution centers and load centers aboard ship. The photograph above illustrates the use of molded case circuit breakers and air circuit breakers in a typical Navy switchboard.

General Ordering Information

When ordering Cutler-Hammer Navy circuit breakers, consult the check list below to make sure you have provided correct information. You should specify:

1. Quantity, Cutler-Hammer Part Number and National Stock Number of:
 - a. Complete breaker or frame, trip unit, fuses (where required) and/or attachments where available.
 - b. Plug-in mounting block or front connecting cable terminals.
 - c. Spare breakers or trip units. (Usually one required for each 10 units or fraction thereof of each current rating.)
 - d. Technical Manuals.
2. Shipment
Specify transportation means, method of packaging and preservation, and required shipping date.
3. Drawings
Specify quantity of outline or master plan drawings required.
4. Inspection
Indicate whether Government Source Inspection (GSI) is required at factory prior to shipment. This should appear as a "shipping note."

Marine Breaker Applications

Eaton also manufactures a complete family of marine circuit breakers for Navy non-combatant ships, U.S. Coast Guard vessels, Military Sealift Command vessels, commercial vessels, offshore drilling rigs, etc. These marine breakers are different from high shock MIL-spec breakers. They meet any or all of various marine specifications such as ABS, USCG-CFR46, IEEE45, UL® 489 Supplements SA and SB, UL 1066 Supplement SA, Lloyd's of London, DNV. Call Eaton for more details.

Types ALB-1 and NLB-1

Circuit Breakers for Naval Shipboard Use — Types ALB-1 and NLB-1 Breakers

125 Volts ac and dc, 50 Amperes
Maximum, 5000 Amperes I.C.

ALB-1 Navy Circuit Breaker

Note:

Clamp type stab terminal for panelboard mounting at line end and pressure type terminal for front connection at load end.

Specification: MIL-C-17588

- 5 – 50 amperes, 60 or 400 cycle.
- 125 volts ac or dc single-pole.

Interrupting Rating

10 – 50 ampere units:
5,000 amperes ac and 2,500
amperes dc.

5 ampere unit: 1,500 amperes
ac or dc.

High shock Navy ALB-1 circuit breakers are designed for shipboard protection of single-phase ac and dc circuits or three-phase ac circuits when breakers are connected by handle yokes for 2- and 3-pole operation.

The NLB-1 breaker is the non-automatic design of the ALB-1. Since the tripping element is omitted, it is used as a manual disconnect.

Non-adjustable thermal and magnetic trip elements are factory calibrated and sealed. The tripping element is counterbalanced to reduce possibility of accidental tripping under shock. All parts are given a corrosion-resistant treatment in compliance with MIL-E-917.

Plug-in line connections simplify panelboard mounting. A clamp type terminal on the line end of the breaker provides plug-in connection to bus stabs in panelboard mounting blocks. For front connection, there is a pressure type terminal on the load end of the breaker.

ALB-1 AND NLB-1 CIRCUIT BREAKER PRODUCT SELECTION — NET WEIGHT 8 OZ. ①

TYPE	AMPERE RATING	STYLE NUMBER	NATIONAL STOCK NUMBER
ALB-1	5	454D507G01	5925-00-204-7494

Characteristic Time-Current Curve ALB-1 Breaker

MIL-C-17588

This specification includes the ALB-1 type circuit breaker. It requires that this breaker carry 115% of current ratings for more than one hour and that the primary elements initiate tripping at 138% rated current within one hour and at 200% in 10 to 100 seconds. A tripping characteristic of the primary element is based on the current flowing through all poles in series and in an ambient of 50°C. The minimum instantaneous trip setting shall be 320 amperes or 20 times the element rating, whichever is less, and trip at not less than 0.5 cycles. At 800 amperes, the breaker must trip at 0.400 second or less.

Characteristic Temperature-Rating Curve

Wiring Diagram

Types AQB-A50, NQB-A50

Circuit Breakers for Naval Shipboard Use — Types AQB-A50, NQB-A50 Breakers

500 Vac, 50 Amperes Maximum,
5000 Amperes I.C.

Specification: MIL-C-17361

- 10 – 50 amperes, 60 and 400 cycle.
- 500 volts ac.
- 3-pole.

Interrupting Rating

- 5,000 amperes ac.
- Non-interchangeable trip unit.
- Class Hi-Shock MIL-S-901, 50°C ambient.

The AQB-A50 is a factory calibrated non-adjustable thermal-magnetic circuit breaker. The circuit breaker is assembled as

a 3-pole device with circuit protecting trip elements in the two outside poles. The unit can be installed in 2-pole applications by connecting the 2-wire circuit to the outside protected poles.

The NQB-A50 breaker is a non-automatic design of the AQB-A50. Since the tripping elements are omitted, it is used as a manual

disconnect. The NQB-A50 has a maximum continuous current rating of 50 amperes.

Circuit Breakers for Naval Shipboard Use — Types AQB-A51, NQB-A51 Breakers

500 Vac, 50 Amperes Maximum, 5000 Amperes I.C.

Specification: MIL-C-17361

- 10 – 50 amperes, 60 cycles.
- 500 volts ac.
- 3-pole.

Interrupting Rating

- 5,000 amperes I.C.
- Non-Interchangeable trip unit.
- Class Hi-Shock MIL-S-901, 50°C ambient.

The Type AQB-A51 molded case circuit breaker is a 500 Vac maximum rated device with 50 ampere maximum continuous current at 60 Hz. The AQB-A51 is a form, fit and function replacement for the AQB-A50 circuit breaker with enhanced overcurrent protection features. In the

AQB-A51, overcurrent protection is provided in all three poles. This not only makes the breaker suitable for use in “grounded” three-phase systems, but offers enhanced performance of the instantaneous trip feature when used in ungrounded systems. In three phase distribution systems with either a solidly or “effectively” grounded neutral, fault currents can occur that will be evident in only one pole, so protection is needed in all three poles. The enhanced instanta-

neous trip feature is valuable in the selective coordination of the AQB-A51 with upstream AQB breakers. The AQB-A51 circuit breaker has an interruption rating of 5000 amperes asymmetric.

The NQB-A51 breaker is a non-automatic design of the AQB-A51. Since the tripping elements are omitted, it is used as a manual disconnect. The NQB-A51 has a maximum continuous current rating of 50 amperes.

Circuit Breakers for Naval Shipboard Use — Types AQB-A100, NQB-A100 Breakers

250 Volts dc, 500 Volts ac, 100 Amperes Maximum, 15,000 Amperes ac, 10,000 Amperes dc I.C.

Note:

AQB-A100 and NQB-A100 breakers are sold for replacement only. They are no longer on the Navy Qualified Product List.

AQB-A100

Specification: MIL-C-17361

- 15 – 100 amperes.
- 500 volts ac and 250 volts dc.
- 2- or 3-pole.

Interrupting Rating

- 15,000 amperes ac and 10,000 amperes dc.

AQB-A100 circuit breakers are designed for use in lighting and distribution panelboards and switchboards for the protection of feeder and motor branch circuits.

Trip units with current ratings of 15, 25, 50, 75 and 100 can be quickly interchanged and a conversion kit is available to change a 3-pole, 500 volt AQB-A100 to a nonautomatic NQB-A100 circuit interrupter. NQB-A100 breakers have a maximum continuous

current rating of 100 amperes, but they are used only as disconnects since there is no automatic opening device.

Those breakers (and interrupters) designed for dc motor circuits and for ac feeder circuits (designated with a “BF” in amp rating column of price table) have fixed instantaneous settings of 600% – 700% continuous current ratings. Those having a magnetic element set to trip at 1200% – 1400% are applied on ac motor circuits (designated with a “B”). Breakers designated with “BE” are calibrated for dc application.

400 Cycle Breakers

Operating Characteristics

Trip Unit Rating 15 – 100 Amperes
50°C Ambient — Cold Start
400 Cycle ac.

Trip Unit Rating

To determine the trip unit rating to be used, when the load current and ambient are known, multiply the load current by the factor obtained from this curve for the known ambient. The result will be the ideal trip unit rating. However, since trip units are furnished only with standard ratings as per Navy spec., select the standard trip unit whose rating is equal to or one rating higher than the ideal rating.

Specification MIL-C-17361

This specification covers all thermal-magnetic AQB breakers. It requires that they carry 150% of current ratings for at least one hour and that thermal elements initiate tripping at 225% rated current within one hour and at 600% in 25 seconds plus or minus 25%. The instantaneous magnetic settings for each continuous ratings are based on intended applications. (Thermal tripping tests are conducted with all poles in series in 50°C ambient; each pole is tested individually to check magnetic settings.)

Types AQB-A101, NOB-A101

Circuit Breakers for Naval Shipboard Use — Types AQB-A101, NOB-A101 Breakers

250 Volts dc, 500 Volts ac, 100
Amperes Maximum, 15,000
Amperes ac, 10,000 Amperes

Specification: MIL-C-17361

- 15 – 100 amperes.
- 500 volts ac and 250 volts dc.
- 3-pole.

Interrupting Rating

- 15,000 amperes ac and 10,000 amperes dc.
- Non-Interchangeable Trip Unit.
- Class: Hi Shock MIL-S-901: 50°C Ambient.

AQB-A101 circuit breakers are designated for use in lighting and distribution panelboards and for switchboards in the protection of feeder and motor branch circuits.

These breakers have adjustable instantaneous trip settings of “LO,” “Intermediate,” and “HI.” The “LO” setting is 500% — 700% of continuous current rating. It is designed for dc motor circuits and ac feeder circuits.

The “HI” setting is 1200% — 1400% of continuous current rating and is designed for application on ac motor circuits. The intermediate setting may be used to increase LO setting trip amperes or decrease HI setting trip amperes as may be required.

NOB-A101 circuit breakers have a maximum continuous current rating of 100 amperes. They are used only as disconnects, since they do not include an automatic opening device.

Generator Breakers

(Designated with a “G”) are also available in other configurations. Consult Eaton.

① For list prices, see Price and Availability Digest (PAD).

② Complete breaker does not include mounting bases. Type required must be ordered separately.

③ Front connected bases include cable lugs. Cover cable sizes 2828CM to 100,000CM.

④ Only 3-pole breakers are furnished, for 2-pole applications make connections to outside poles.

⑤ Instantaneous trip setting at 1200 – 1400% HI or 500 – 700% LO. Set at LO position at factory.

⑥ Manufactured to meet MIL-C 17361 D or prior revisions only.

⑦ “G” indicates generator breakers. Refer to Eaton for further information.

Note:

These breakers are non-repairable per NAVSEA letter, serial number 9077 Ser 03/03 EI-48, paragraph 3 Policy, sub-paragraph 2, dated 25 October 1994.

① Individual fuses are not replaceable; replace with complete unit.

② To convert for use with high rating unit (AQB-F101B) in field, remove rejection pin per instructions on fuse unit mounting base nameplate.

Additions

Shunt Trip

Breakers can be equipped with a shunt trip attachment for tripping the breaker from a remote point, and can be supplied with coils for 120 volts, 60 cycle or for 120 volts dc. These shunt trips have momentary rated coils and are supplied with an auxiliary switch to be wired in series for protection (Auxiliary switch included with the shunt trip. Do not order separately). Shunt trips are always mounted in the right pole. Leads extend 36 inches outside of breaker. For 400 Hz shunt trip contact Eaton.

To order, specify style number of standard breaker required plus shunt trip voltage and frequency. Must be factory installed. Net weight .3 lbs.

Auxiliary Switch

Breakers can be supplied with internally mounted auxiliary switch to open or close control circuits as breaker operates. Each switch provides one "A" contact and one "B" contact. "A" contact is closed when breaker is closed, open when breaker is open. "B" contact is open when breaker is closed and closed when breaker is open. When ordered with one switch it is normally mounted in right pole, may be specified mounted in left pole. A maximum of 2 switches can be supplied: one in left and one in right pole. Order by description. Must be factory installed. Net weight .3 lbs.

Note:

One auxiliary switch normally supplied with shunt trip attachments for cut-off switch and additional switches cannot be supplied on breakers with shunt trips.

Handle Lock

When specified, order style 1614485.

NSN 5930-00-669-7524.

Handle Boot

When specified, order style number 752B729H01.

Rear Stud

Complete with 4 nuts, style number 208B801G01.

Fungus-Moisture Resistant Treatment

(JAN-T-152, JAN-C-173 or MIL-V-173). If specified, contact Eaton. External parts are coated.

Technical Manual

Navships No. 362-2314. This booklet per MIL-M-15071. When required, order BVR-TM-475C.

Drawings Available

Characteristic Time-Current Curves

AQB-A101 Breakers

Operating Characteristics

Trip Unit Rating 15 – 100 Amperes 50°C Ambient — Cold Start, 60 Cycle, ac or dc, Thermal-Magnetic.

400 Cycle Breakers

Operating Characteristics

Trip Unit Rating 15 – 100 Amperes 50°C Ambient — Cold Start 400 Cycle ac, Thermal-Magnetic Trip Unit Rating.

Trip Unit Rating

To determine the trip unit rating to be used, when the load current and ambient are known, multiply the load current by the factor obtained from this curve for the known ambient. The result will be the ideal trip unit rating. However, since trip units are furnished only with standard ratings as per Navy spec., select the standard trip unit whose rating is equal to or one rating higher than the ideal rating.

Specification MIL-C-17361

This specification covers all thermal-magnetic AQB breakers. It requires that they carry 150% of current ratings for at least one hour and that thermal elements initiate tripping at 225% rated current within one hour and at 600% in 25 seconds plus or minus 25%. The instantaneous magnetic settings for each continuous ratings are based on intended applications. (Thermal tripping tests are conducted with all poles in series in 50°C ambient; each pole is tested individually to check magnetic settings.)

Characteristic Time-Current Curves

Generator Breakers

50°C Ambient — Cold Start "G" rating, 60 or 400 Cycle ac or dc, Thermal-Magnetic.

Types AQB-A103RMS, NQB-A103

Circuit Breakers for Naval Shipboard Use — Types AQB-A103 RMS, NQB-A103 Breakers

500 Volts ac, 100 Amperes
Maximum, 15,000 Amperes I.C.

Specifications: MIL-C-17361

- 10 – 100 amperes.
- 500 volts ac (No dc).
- 60/400 Hz (Universal).
- 3-pole.

Interrupting Rating

- 15,000 amperes, 60 Hz ac.
- 7,500 amperes, 400 Hz ac.
- 100 kA with fuse kit units.
- Class: Hi shock MIL-S-901: 50°C ambient.

AQB-A103 RMS circuit breakers are designated for use in lighting and distribution panelboards and for switchboards in the protection of feeder and motor branch circuits.

The AQB-A103 RMS now features true rms sensing, which works on any waveform shape, is more accurate and is less sensitive to nuisance tripping. AQB-A103 RMS circuit breakers are form fit and function interchangeable with A101 circuit breakers. The electronic trip unit provides better shock immunity, enhanced trip curve shaping capabilities, improved selectivity and system coordination, and dramatic logistical savings.

NQB-A103 circuit breakers have a maximum continuous current rating of 100 amperes. They are used only as disconnects, since they do not include an automatic opening device.

AQB-A103RMS Characteristics

Continuous Current Setting (6-Position Selector Switch)

10 – 25 Amperes (10, 12.5, 15, 18.75, 20, 25)

40 – 100 Amperes (40, 50, 60, 75, 80, 100)

Instantaneous Pickup — Adjustable in multiples of 25 or 100 ampere frame rating (6x, 8x, 10x, 12x, 15x, 20x, 30x, 40x)

Short Delay Pickup — Adjustable in multiples of continuous current setting (2x, 3x, 5x, 7x, 9x, 10x, 13x, 14x)

Short Delay Time — Adjustable with bands Min., 1, 2, 3, Max., plus 3 new flat response curves at 100 ms, 200 ms and 300 ms. (See trip curve.)

Net Weight

AQB — 6.0 lbs. (2.7 kg.)

NQB — 5.75 lbs. (2.6 kg.)

- 2- and 3-pole.

Interrupting Ratings

- 20,000 amperes ac and
15,000 amperes dc.

AQB-A250 circuit breakers are used primarily to protect feeder circuits, however, those followed by “NM” in the table have higher magnetic settings to allow for motor starting. Breakers with settings specifically for use with generators are designated “NG” in the table.

These breakers are available with interchangeable trip units in ratings of 125, 150, 175, 225 and 250 amperes. The nonautomatic NQB-A250 carries a 250 ampere rating and has copper conductors replacing the trip unit. Special generator breakers have trip units rated at 100, 160 and 250 amperes.

AQB-A250 breakers can be ordered with undervoltage release devices, auxiliary switches and shunt trip attachments complete with auxiliary switch. These attachments are also easily installed in the field.

① For list prices, see Price and Availability Digest (PAD).

② For 400 cycle breakers with higher instantaneous trip ratings, refer to Eaton.

③ Styles listed include slip-type connectors for rear connections. Order front terminal connectors separately if required. No additional charges for front connectors ordered with breakers or frames.

④ Not to be used with attachments; see prior Page 48.

Note:

Breakers with ratings other than those given on this page are considered as special and full description data must be provided.

Switchboard Mounting

Complete breakers and frames include mounting hardware. Female slip connectors are mounted in breaker base to plug onto stud projections of terminal mounting block assemblies. Order one mounting block assembly for each end of breaker.

DESCRIPTION	STYLE NUMBER	NET WEIGHT, LBS. (KG)	NATIONAL STOCK NUMBER
One Stud Assembly Complete with 4 Nuts	1631 443	1 (0.5)	—
Terminal Mounting Block (No Studs)	313C681G01	1 (0.5)	2920-01-354-4811

Additions

Handle Lock

If required, order style 28B4596G01. One furnished no charge per 10 breakers ordered, when requested. Net weight 0.15 lbs. (0.07 kg).

Mechanical Interlock

If mechanical interlock (switch-board use) is desired for a pair of breakers, order by description. (Not submitted for Navy approval.)

Auxiliary Switch

The most commonly used, standard mounting is left pole with leads exiting rear when required, is style 452D379G02, national stock number 5930-00-732-8401. Internally mounted switch is used to open or close control circuits as breaker operates and is provided with "A" and "B" contacts. "A" contact is normally closed when breaker is closed and open when breaker is open; "B" is normally open when breaker is closed and closed with breaker open. It has the following rating at given voltages: 15 ampere — 125, 250 or 460 volts ac; 1/2 amperes — 125 volts dc; 1/4 ampere — 250 volts dc. Net weight, 0.17 lb. (0.08 kg).

If 2A/2B auxiliary switch is required, order Style 452D379G04, NSN 5930-00-509-2483.

Contact Eaton for other ratings or types of mounting.

Fungus — Moisture — Resistant Treatments

(JAN-T-152; JAN-C-173 or MIL-V-173): If specified, contact Eaton. External parts are coated; trip units are not treated.

Technical Manual — NAVSHIPS No. 362-2164

This booklet per MIL-M-15071. When required, order BVR-TM-379A.

Motor Operator

6590C87G01 — 115 Vac, 60 Hz

Shunt Trip

Shunt trip attachments for tripping the breaker electrically from a remote point are listed in table below. Shunt trips have momentary rating only and for protection must be connected in series with auxiliary switch. Net weight, 0.70 lb. (0.3 kg) Contact Eaton for 400 Hz. shunt trips.

- ① These shunt trips require a separate auxiliary switch be ordered.
 ② These shunt trips are mounted standard right pole with rear leads.

- ③ These shunt trips are mounted left pole with rear leads.
 ④ These shunt trips already include the required auxiliary switch.

Undervoltage Device

Automatically trips breaker when line voltage drops below 40 to 60% of normal. After undervoltage coil has dropped out and tripped breaker on reduced voltage, it automatically resets by breaker action. (If undervoltage coil is energized to 80% of normal). Select device from table to the right. Net weight, 1.12 lbs. (0.5 kg).

Motor Operator On Navy — Type AQB-A250 and NQB- A250 Molded Case Circuit Breakers

**AQB-A250 on Left With Handle
Extension and Unmounted Motor
Operator on Right**

The motor operator is a mechanism for remote circuit breaker ON and OFF switching. The motor operator is mounted to the circuit breaker and provides high speed switching with operating times of approximately 14 cycles (235 milliseconds).

Motor operators for use on the AQB-A250 and NQB-A250 circuit breakers are rated at 115 Vac, 60 Hz, and require a minimum 1 kVA power source. In addition, all motor operators are equipped with an Auto-Reset feature as standard.

The motor operator is designed to remotely switch a circuit breaker to its ON, OFF and relatch positions. The relatch (Auto-Reset) function will occur automatically after a circuit breaker trip operation. The motor operator is self contained and assembled in its own mounting frame which mounts on the front of the circuit breaker. When the ON or OFF remote control button is pressed, current flows to the electric motor which turns a

ball bearing and screw assembly driving the carrier and roller assembly. Two rollers fit over the circuit breaker handle and move with the handle through its range of movement. Limit switches control the travel of the carrier assembly. A terminal block is provided in the mounting frame for control connections. A “b” contact auxiliary switch is provided for installation in the breaker for the Auto-Reset function.

Characteristic Time-Current Curves

Specification MIL-C-17361

This specification covers all thermal-magnetic AQB breakers. It requires that they carry 150% of current ratings for at least one hour and that thermal elements initiate tripping at 225% rated current within one hour and at 600% in 25 seconds plus or minus 25%. The instantaneous magnetic settings for each continuous ratings are based on intended applications. (Thermal tripping tests are conducted with all poles in series in 50°C ambient; each pole is tested individually to check magnetic settings.)

400 CYCLE BREAKERS

Operating Characteristics

Trip Unit Rating 125 – 250
Amperes 50°C Ambient —
Cold Start, 400 Cycle ac.

Trip Unit Rating

To determine the trip unit rating to be used, when the load current and ambient are known, multiply the load current by the factor obtained from this curve for the known ambient. The result will be the ideal trip unit rating. However, since trip units are furnished only with standard ratings as per Navy spec., select the standard trip unit whose rating is equal to or one rating higher than the ideal rating.

Types AQB-LF100, AQB-LF250

Circuit Breakers for Naval Shipboard Use Types AQB-LF100, AQB-LF250 Breakers

Type AQB-LF100, 100 Amperes Maximum, Type AQB-LF250, 250 Amperes Maximum, 500 Volts ac, 100,000 Amperes I.C.

AQB-LF100 Fused Navy Circuit Breaker

AQB-LF250 Fused Navy Circuit Breaker

Note:

AQB-LF100 breakers are sold for replacement only. They are no longer on the Navy Qualified Product List.

Application

AQB-LF100 and AQB-LF250 circuit breakers are for use in low-voltage distribution systems where available fault current exceeds the interrupting ratings of standard molded case breakers but does not exceed 100,000 amperes.

Like standard Navy breakers, they are designed for use in switchboards, loadcenters and panelboards.

AQB-LF circuit breakers are available in three-pole design and for rear connection only.

Description

These breakers are essentially standard Navy circuit breakers incorporating current limiting fuses in one compact device. The fuses are mounted in a removable molded housing which plugs into and becomes an integral part of the breaker. Fuses are easily replaced from the front simply by loosening four screws and pulling out the fuse housing.

An interlock prevents the breaker from being closed if any of the three fuses are blown and the fuse housing is designed so that all three fuses must be unblown before the housing can be mounted in its correct position on the breaker. Removal of the fuse housing automatically opens breaker and provides visual assurance that the circuit is disconnected.

Operation

The thermal-magnetic trip unit of the standard breaker provides protection on overloads and short circuits below a predetermined value without affecting the fuses. However, these specially coordinated fuses assume the fault clearing duty on high magnitude short circuits and extend the interrupting capacity to 100,000 amperes.

The common trip feature of the circuit breaker is retained so that all poles open when any fuse blows. Fast acting current limiting fuses clear short circuits in less than one-half cycle. Consequently, peak let-through currents are greatly reduced and bus-supporting members or current carrying parts do not have to be designed to meet maximum peak current.

AQB-LF100 Fused Breaker

Specification: MIL-C-17361

- 15 – 100 Amperes, 500 Volts ac, 60 Cycles, 3-Pole

Interrupting Rating

- 100,000 Amperes

Note:

AQB-LF100 breakers are sold for replacement only. They are no longer on Navy Qualified Product List.

AQB-LF100 breakers are designed for the same application as the AQB-A100 (non-fused) circuit breaker except that they may be applied on circuits where fault currents up to 100,000 amperes are available. Breakers designated by the

suffix “DF” in the table have settings designed for the protection of feeder circuits and those followed by “D” have higher magnetic settings to allow for motor starting.

AQB-LF250 Fused Breaker

Specification: MIL-C-17361

- 125 – 250 amperes, 500 volts ac, 60 cycles, 3-pole.

Interrupting Rating

- 100,000 amperes.

These fused breakers are designed for applications similar to those for AQB-A250 (non-fused). However, because of their current limiting fuses, they can be applied on circuits with available fault currents up to 100,000 amperes.

Undervoltage release devices, shunt trips and/or auxiliary switches are available for the AQB-LF250 and can be easily installed in the field.

Those breakers identified by the suffix "LM" in the table have higher magnetic settings for motor starting while those carrying the suffix "L" are set for the protection of feeder circuits

100,000 Amperes I.C. Breakers

Specifications: MIL-C-17361

- 100 – 250 amperes, 100% Rated.
- AQB-A253: 500 volts ac, 60/400 Hz.
- AQB-L253: 500 volts ac, 60 Hz.
- NQB-A253: 500 volts ac, 60/400 Hz.
- No dc.
- Interchangeable Electronic Trip with rms sensing.
- 3-pole.

Interrupting Rating

- AQB-A253: 30,000 amperes, 60 Hz ac.
- 10,000 amperes, 400 Hz ac.
- AQB-L253: 100,000 amperes, 60 Hz ac.
- NQB-A253: Non Overcurrent Protection.
- Class: Hi shock MIL-S-901D, 50°C ambient.

Description

The AQB-A253, 250 ampere circuit breaker, is form and fit interchangeable with the AQB-A250 but has an electronic trip unit and higher interrupting capacity. It is available in a 3-pole, ac current version only. If used to protect two ac poles, connect only the outer poles. It is a universal style with a common trip unit and 60 Hz and 400 Hz ratings.

The AQB-L253 is a high interruption version of the AQB-A253 in the same external package. It uses fuseless current-limiting technology to achieve 100 kA interrupting capacity so it can be used to replace the AQB-LF250 without the logistic concerns of fuse replacement. The AQB-L253 utilizes a smaller package and offers a significant weight reduction compared to the LF250. The -L253 is available in only a 60 Hz version.

The NQB-A253 circuit breaker has a maximum continuous current rating of 250 amperes. They are used only as disconnects, since they do not include an automatic opening device.

The AQB-A253 and L253 are supplied with a universal trip unit that is used in all AQB versions. The trip unit must be equipped with an adjustable rating plug (ordered separately) that determines the continuous current rating of the complete circuit breaker. Two adjustable rating plugs are available. One covers the continuous current settings of 250, 225, 200 and 175 amperes and the other covers the current settings of 160, 150, 125 and 100 amperes.

The interchangeable electronic trip unit (ETU) has an adjustable time-current curve with selectable values of Short Time Delay Pickup (STDPU) (scaled to the CCS) and Short Time Delay (STD) for improved coordination with upstream or downstream devices. The trip unit also has an instantaneous override trip fixed at 7500 A (30 x frame rating). The ETU can emulate the trip curve of the AQB-A250 by setting the STD to INST and using the STDPU to emulate an adjustable INST setting.

Principle of Operation

These circuit breakers are designed to provide the most modern form of low voltage circuit protection technology available, providing high interruption ratings and flexible coordination without the need for current limiting fuses. The breakers use modern electromagnetic design principles to increase the interrupting capacity (IC) to significantly higher levels than comparable AQB-A250 breakers. The AQB-L253 uses a “reverse loop” conductor design and “magnetically unlatched” contact arms to provide very high interrupting capacity while limiting the let-through current and limiting the fault duration to a few milliseconds.

Ordering

The circuit breaker is available in three styles, an AQB-A253 (standard IC), an AQB-L253 (high IC) and an NQB-A253 (non-automatic) switch. The breaker is completed by adding one of two styles of rating plugs, one which covers the continuous current range from 250 – 175 amperes and another which covers the range from 160 – 100 amperes. An internally mounted auxiliary switch, a shunt trip and an under-voltage release are also available.

AQB-A253, AQB-L253 Characteristics

Continuous Current Setting (4-Position Selector Switch) —

100 – 160 amperes (100, 125, 150, 160) rating plug

175 – 250 amperes (175, 200, 225, 250) rating plug

Instantaneous Pickup — Fixed at 30 X Frame rating (7500 A).

Short Delay Pickup — Adjustable in multiples of continuous current settings (2x, 3x, 4x, 6x, 8x, 10x, 12x, 13x).

Short Time Delay — Adjustable flat response with bands:

- INST (.025 – .050 seconds).
- 0.100 seconds (.058 – .083 seconds).
- 0.200 seconds (.158 – .183 seconds).
- 0.300 seconds (.258 – .283 seconds).

Auxiliary Switch

The auxiliary switch (AS) changes state with the circuit breaker. Auxiliary switches supplied with this breaker are form C (SPDT) with 3 lead wires.

The "a" (normally open) contact mimics the action of the main contacts and the "b" (normally closed) contact is opposite. This switch is mounted in the right pole of the circuit breaker and must be factory installed.

DESCRIPTION	STYLE NUMBER	NATIONAL STOCK NUMBER	NET WEIGHT, LBS. (KG)
Auxiliary Switch, 1a/1b, 115 Vac, 10 Amperes	1483D90G01	5930-01-558-9236	0.5 (0.2)
Auxiliary Switch, 2a/2b, 115 Vac, 10 Amperes	1483D90G02	5930-01-559-4835	0.5 (0.2)

Shunt Trip

The Shunt Trip (ST) is provided to remotely trip (open) the circuit breaker in response to a remote signal applied to the accessory device. It is available in a variety of voltage ratings (see below).

It is a momentary device that draws power briefly and then is disconnected by an integral cutoff switch (included). It is mounted in the left pole of the breaker and can be installed only in the absence of an undervoltage release.

NOMINAL VOLTAGE	STYLE NUMBER	NATIONAL STOCK NUMBER	NET WEIGHT, LBS. (KG)
115 Vac, 50/60 Hz	1483D92G03	5925-01-481-5863	0.5 (0.2)

120 Vdc	1483D92G02	5925-01-558-9230	0.5 (0.2)
250 Vdc	1483D92G06		0.5 (0.2)

^① Please check with Eaton for availability.

Undervoltage Release

The undervoltage release (UVR) will trip the circuit breaker and hold it in a tripped condition if the control voltage to the UVR drops below 40% to 60% of nominal. After the UVR has tripped the breaker it will be mechanically reset by the opening action of

the breaker and electromagnetically latched if the applied voltage returns to at least 80% of nominal. It mounts in the left pole of the circuit breaker cover and can only be used in the absence of a shunt trip device.

FACTORY INSTALL ONLY.

NOMINAL VOLTAGE	STYLE NUMBER	NATIONAL STOCK NUMBER	NET WEIGHT, LBS. (KG)
115 Vac, 50/60 Hz	1483D91G01	—	0.5 (0.2)

AQB-LF250 Adapter Plate

This close-out plate is required when the AQB-L253 is used to replace an existing AQB-LF250

circuit breaker. The plate closes the hole in the switchboard or panelboard where the fuse pack of the -LF250 protruded.

DESCRIPTION	STYLE NUMBER	NATIONAL STOCK NUMBER	NET WEIGHT, LBS. (KG)

Types AQB-A253, AQB-L253 and NQB-A253

Master Drawing 1483D48.

Motor Operator

An electrical motor operator is available which mounts on the front face of the circuit breaker and can be used for remotely opening or closing the breaker.

It provides high speed actuation with operating times of approximately 10 cycles (0.17 seconds). Motor operators for the -A253 or -L253 are rated at 120 Vac but can be used at 450 Vac with a customer-supplied 1 kVA step-

down transformer. A handle extension is also provided for installation on the circuit breaker handle. Eaton recommends a minimum 1 kVA power source for each motor operator.

NOMINAL VOLTAGE	STYLE NUMBER	NATIONAL STOCK NUMBER	NET WEIGHT, LBS. (KG)
120 Vac/Vdc, 60/400 Hz	1483D93G01	5925-01-542-4620	22.0 (10.0)

Handle Lock

A handle lock can be furnished to lock the handle in either the ON

or OFF position if required. It consists of a special bracket held in place with a cotter pin.

DESCRIPTION	STYLE NUMBER	NATIONAL STOCK NUMBER	NET WEIGHT, LBS. (KG)
Handle Lock	1720101	—	0.15 (0.07)
Handle Extension	5103A34G01		

Trip Unit Tester

A portable tester can be used to functionally check the circuit breaker and trip unit for overload

and short circuit trip settings. The test port is located on the front of the trip unit and can be accessed while the circuit breaker is mounted.

This test kit is common to all Navy circuit breakers with electronic trip units.

L253	Interrupting Current	30 kA	10 kA
		100 kA	-

- Notes**
- Curve accuracy applies from -20°C to +55°C ambient. For possible continuous ampere derating for ambient above 50°C, refer to Cutler-Hammer.
 - For high fault current level a fixed instantaneous override is provided at 7500A. (Tolerance ±20%).
 - The end of the curve is determined by the interrupting rating of the circuit breaker.
 - AOB-A/L253's are suitable for functional field testing with test kit Cat. Number STK2.
 - Calibration response in short delay pickup range is same for 1, 2 or 3 poles in series.
 - There are memory effects that can act to shorten the long delay. The memory effects come into play if a current above the long delay pickup value exists for a time and then is cleared by the tripping of a downstream device or the circuit breaker itself. A subsequent overload will cause the circuit breaker to trip in shorter time than normal. The amount of time delay reduction is inverse to the amount of time that has elapsed since the previous overload. Approximately five minutes are required between overloads to completely reset the memory.

CURVE NO. SC-7238-99

Types AQB-L400, AQB-LL400

Circuit Breakers for Naval Shipboard Use — Types AQB-L400, AQB-LL400 Breakers

Types AQB-L400QF, AQB-L400QM: 150,000 Amperes I.C. and AQB-LL400QS: 100,000 Amperes I.C. 250 – 400 Amperes; 500 Volts ac, 60 Hz.

AQB-LL400QS Breaker

*Motor Operator Mounted on
Circuit Breaker*

AQB-L400QF, AQB-L400QM and AQB-LL400QS current limiting circuit breakers are designed for installation in switchboards for protection of generators and feeders and branch circuits with available fault currents of 150,000 amperes maximum.

Description

The Navy Type AQB-L400QF, AQB-L400QM, and AQB-LL400QS molded case circuit breakers are 500 Vac maximum rated devices with electronic trip units rated at 400 amperes maximum continuous current at 60 Hz. The circuit breakers are assembled as 3-pole units which may be used as 2- or 3-pole devices.

The circuit breakers are designed to MIL-C-17361 and meet the requirements of Class HI-shock, MIL-S-901. The circuit breaker electronic trip unit has adjustable short delay time and pickup trip settings which can be readily changed at the operator level to meet the shipboard system trip requirements. Four interchangeable rating-plugs are available to select the continuous current rating of 250, 300, 350 or 400 amperes. Also provided is a non-adjustable inverse time delay tripping action for overload conditions, and instantaneous tripping for protection against short circuit conditions that exceed the preset short delay pickup setting. In open air at 50°C, the circuit breaker will carry continuously a current equal to the ampere rating of the installed rating plug. The calibration of the trip unit is insensitive to ambient temperatures over a range of -20°C to +70°C.

Operation

The AQB-L400QF, AQB-L400QM, and AQB-LL400QS current limiting circuit breakers (without the need for current limiting fuses) are designed to provide circuit protection for low voltage distribution systems. The circuit breakers will disconnect a load from an electrical supply when the handle is operated, when an overcurrent or short circuit condition develops, or when the push-to-trip button in the trip unit is manually pressed. A complete breaker consists of a breaker, rating plug plus mounting blocks and is available with numerous attachments such as electrical operator, shunt trip, undervoltage release and auxiliary switches to perform varied auxiliary functions.

The circuit breaker has a spring-loaded independent over-toggle operating mechanism that provides a quick-make quick-break trip-free operation.

The operating mechanism also provides the electro-mechanical means to open the contacts when trip conditions occur. When current is flowing through the contacts of the circuit breaker, the positions of the lower contact arms and the moving contact arms induce opposing magnetic fields. The resulting opposing forces along the magnetic flux lines cause rapid contact blow-apart under high current fault conditions. The AQB-L400QF and AQB-L400QM circuit breakers have slot motors for each moving contact arm to intensify the magnetic field and further increase the blow-apart effect.

Specifications

- AQB-L400QF, AQB-L400QM and AQB-LL400QS Current Limiting Navy Circuit Breakers.
- 250 – 400 Amperes, 500 Volts ac, 60 Hz.

Note:

Call Eaton for 400 Hz.

- 3-Pole Only, 50°C Ambient.

Continuous Current Rating

- 250, 300, 350 and 400 Amperes.

Current Interruption Ratings

- AQB-L400QF — 150,000 Amperes
- AQB-L400QM — 150,000 Amperes
- AQB-LL400QS — 100,000 Amperes

Protective Functions

- Long Delay Pickup (Minimum Thermal Trip) (Fixed) 131% to 156% (All Ratings)

Protective Functions

Short Delay Pickup (Adjustable)

- AQB-L400QF — 650 – 1500 Amperes
- AQB-L400QM — 1700 – 3200 Amperes
- AQB-LL400QS — 3600 – 5800 Amperes

Short Delay Time (Adjustable)

- MIN, 1, 2, 3, MAX. (5 Bands)
- See Trip Curves or MIL-Spec

Instantaneous Pickup (Fixed)

- AQB-L400QF — 1850 Amperes
- AQB-L400QM — 3280 Amperes
- AQB-LL400QS — 6300 Amperes

This enables these circuit breakers to have an interrupting rating of 150 kA compared with the AQB-LL400QS rating of 100 kA.

MAGNETIC FIELD WITH SLOT MOTOR

A push-to-trip button is provided to manually trip the circuit breaker. When the button is pressed, a plunger rotates the latch lever causing the circuit breaker to trip.

All trip units are built into the circuit breaker frames and use electronic sensing elements. The Types AQB-L400QF, AQB-L400QM, and AQB-LL400QS Seltronic trip units provide protection functions. All trip units are supplied electrically from current sensors mounted on the main conductors in the circuit breaker base. A field-installed rating plug determines the continuous ampere rating of the trip unit. An electrical interlock causes the circuit breaker to trip at current levels of 75% or more if the rating plug is not installed. Under fault conditions, the trip unit will initiate a trip signal and energize the flux shunt trip. When the flux shunt trip operates, the plunger extends and rotates the trip lever. As the trip lever rotates, the latch lever rotates which unlatches the trigger and the circuit breaker trips.

Overload Trip — The trip unit initiates an ultimate trip of the circuit breaker within one hour for an overload of 131% to 156%, and in less time for higher overloads.

Short Delay Trip — For short circuit conditions that exceed the short delay pickup setting but not the instantaneous (override) pickup, the trip unit initiates a trip after the selected short delay time setting.

Instantaneous Trip — For short circuit conditions that exceed the instantaneous (override) pickup value, but not the current-limiting threshold, the trip unit initiates a trip with no intentional delay.

② Does not include rating plug.

Motor Operator

The motor operator is designed to remotely switch a circuit breaker to its ON, OFF and relatch positions. The relatch function will occur automatically after a circuit breaker trip operation. The motor operator is self-contained and assembled in its own mounting frame which mounts on the front of the circuit breaker. When the ON or OFF remote control button is pressed,

current flows to the electric motor which turns a ball bearing and screw assembly driving the carrier and roller assembly. Two rollers fit over the circuit breaker handle and move with the handle through its range of movement. Limit switches control the travel of the carrier assembly. A terminal block is provided in the mounting frame for control connections.

Bell alarm 752B515G01 is included.

Eaton Adapter Kit and Navy Type AQB-L400 Molded Case Circuit Breaker Combination in AQB-LF400

The Navy Type AQB-L400 or AQB-LL400 circuit breakers when supplied with a factory installed Eaton AQB-L400 Adapter Kit, can be installed directly into Navy Type AQB-LF400 applications. This combination of an AQB-L400/LL400 circuit breaker and the Eaton Adapter Kit provides a direct one-to-one current limiting type L400 circuit breaker replacement for an already installed fused type LF400 circuit breaker. Existing AQB-L400/LL400 circuit breakers in the field (manufactured prior to August, 1992) may need a factory modification to accept the Adapter Kit. Contact Eaton for details, if there are any questions.

An Eaton AQB-L400 Adapter Kit provides the means for converting the normally male configured primary connections of an AQB-L400/LL400 current limiting circuit breaker to female configured primary connections, normally associated with an AQB-LF400 circuit breaker. A close out plate, attached directly to the front of the AQB-L400 circuit breaker with four mounting screws, provides the deadfront cover required to complete the conversion. This close out plate blanks out the hole in the switchboard door or cover, through which the LF400 fuse pack protruded.

The adapter kit itself is comprised of line and load side adapter blocks, six female spring loaded primary connection adapters, a close out plate, and four mounting screws.

Circuit Breakers for Naval Shipboard Use — Type NQB-A803

500 Volts ac, 800 Amperes at 60 Hz, 650 Amperes at 400 Hz

Specifications: MIL-C-17361

- 800 amperes at 60 Hz, 650 amperes at 400 Hz.
- 500 volts ac, 60/400 Hz.
- 3-Pole.

Interrupting Rating

- Non-overcurrent protection.
- Class: Hi Shock MIL-S-901D, 50°C ambient.

500 – 1600 Amperes; 500 Volts,
60 Hz ac, 75,000 Amperes I.C.

Breaker Only

Breaker and Mounting Base

Note:
AQB-A1601 are sold for replacement only. They are no longer on the Navy Qualified Products List.

Specification: MIL-C-17361

- 500 – 1600 Amperes.
- 500 Volts ac, 60 Cycles Only, 3-Pole, 50°C Ambient.

Interrupting Rating

- 75,000 Amperes ac (Without Delayed Instantaneous).
- 50,000 Amperes ac (With Delayed Instantaneous).

Class: Hi Shock MIL-S-901
Vibration: MIL-STD-167-1
Material and Workmanship: MIL-E-917

AQB-A1601 circuit breakers are designed for installation in switchboards for protection of generators and feeder and branch circuits.

A complete breaker consists of a breaker plus mounting base and is available with numerous attachments such as electrical operator, shunt trip, undervoltage release and auxiliary switches to perform varied auxiliary functions.

Trip units for these breakers have an adjustable instantaneous trip and are listed with and without delayed instantaneous trip for system coordination.

NQB-A1601 Breakers have a continuous rating of 1600 amperes. They are used only as disconnects since they do not have an automatic trip device.

Note:
Breakers with ratings other than those listed above are considered as special and full descriptive data must be provided.

400 cycle breakers are not available.

Note: A1601 PRODUCTS ARE NO LONGER AVAILABLE.

Mounting Base

For switchboard mounting. Includes back connectors for switchboard bus and male stabs to engage breaker. Matching stabs are supplied with breaker frame.

Note:
Can be field mounted. Consult factory for information.

Style Number: 373D307G02

National Stock Number:
6110-01-178-5434

Electrical Operator

Mounts to front of breaker for remote operation. 450 volt ac rating utilizes a transformer in conjunction with a 120 volt motor. If automatic reset is desired, order the circuit breaker with optional Automatic Reset Switch (See Optional Additions).

Note:
Can be field mounted. Consult factory for information.

RATING	STYLE NUMBER	NATIONAL STOCK NUMBER
120 Vac	1371D38G06	None
450 Vac	1371D38G08	Assigned

Optional Additions

Note:
Can be field mounted. Consult factory for information.

Shunt Trip

Mounts in right pole only. Has momentary rating only; coil leads must be wired in series with 1A contact of auxiliary switch. (28 Vdc/120 Vac or 120 Vdc/450 Vac.)

Note:
Breaker can be supplied with either shunt trip or undervoltage release, but not both.

Undervoltage Release

Mounts in right pole only.

Note:
Breaker can be supplied with either shunt trip or undervoltage release, but not both.

Auxiliary Switch

Mounts in left pole only. 4 contacts, any combination of A's and B's, (supplied as 2A and 2B unless specified) 8 contacts, any combination of A's and B's, (supplied as 4A and 4B unless specified).

Automatic Reset Switch

For use with motor operator when an automatic reset function is required. Factory installed only.

Cable Connector

Mounts to bus connector for cable connection. Each lug accepts four cables, 600 kcmil maximum 1 lug required per bus connector.

Style Number: 505C706G03

Fungus, Moisture-Resistant Treatment

(JAN-C-173 or MIL-V-173):
If specified, contact Eaton. External parts are coated; trip units are not treated.

**Characteristic Time-Current
Curves, Continued**

DERATING CURVE

Factor for change in current rating of circuit breaker with change in ambient temperature.

Application

1. Known Conditions:
(A) Ambient
(B) Load Current

To determine trip unit rating to be used when the load current and ambient are known, multiply the load current by the factor obtained from this curve for the known ambient. The result will be the ideal trip unit rating, however, since trip units are furnished with only standard ratings as per Navy Specs, select the standard trip unit whose rating is equal to or one rating higher than the ideal rating.

2. Known Conditions:
(A) Ambient
(B) Load Current

To determine the load current on which a trip unit may be used when ambient is known, divide the trip unit rating by the value obtained from this curve for the known ambient. The result will be the maximum load current on which the trip unit should be used.

**AQB-A1602 Navy Breaker with
Cassette**

The AQB-A1602 is a compact, low maintenance, low voltage circuit breaker in an insulated case providing high interrupting capability and a short-time withstand rating in a drawout frame.

It is a militarized version of the Cutler-Hammer Systems Power Breaker (SPB) and it meets the requirements of MIL-C-17361/15, MIL-S-901 Shock and MIL-STD-167-1 vibration.

The AQB-A1602 has protection features which are identical to those provided by Navy type air circuit breakers as per MIL-C-17587.

Technical Manual

6591C33H01

Applications

- Main generator and tie breaker on small combatant ships.
- Load center feeder breaker on larger ships.
- Bus transfer switch breaker.

Ratings

- AQB-A1602, NQB-A1602.
- 500 Vac, 60 Hz.
- 400 to 1600 Ampere via field replaceable rating plugs.
- 1600 ampere frame — 800 to 1600 amperes.
- 800 ampere frame — 400 to 800 amperes.
- 85 kA symmetrical rms interrupting rating or 100 kA asymmetrical rms.
- 50 kA symmetrical rms, 0.3 seconds short-time withstand rating.

Trip Unit Characteristics

- Long time pickup — fixed at 150% of rating plug.
- Long time delay — see trip curve.
- Short time pickup — adjustable at 2, 2.5, 3, 4, 5, 6, 7 or 8 times rating plug.
- Short time delay — adjustable at 1 (instantaneous), 0.10, 0.20 or 0.30 seconds.
- Instantaneous pickup (override) factory selectable at 10, 15 or 20 times frame rating.

Features

- Affordable.
- Compact and lightweight.
- Full line of field installable attachments.
- Secondary contacts automatically disconnect.
- “T” connector on drawout cassette allows switchboard bus runs to be vertical or horizontal.
- Cassette has self-contained rail extensions for withdrawing the breaker
- Integral spring stored energy electric operator or manual operation.
- Solid-state electronic trip unit with adjustable short-time protection.
- Portable Test Kit for field testing Catalog number STK2.

**ACB3200/4000HR Air Circuit Breaker
Stationary Drawout Cassette**

The circuit breaker is a device for interrupting, in air, a circuit between separable contacts under normal and abnormal conditions. It is supplied as a complete removable assembly including drawout, stationary frame and secondary control contacts in a three-pole construction.

The main power circuit consists of butt type main and arcing contacts. The function of the main contacts is to carry full-rated current and short circuit current when the circuit breaker is closed. The arcing contacts transfer the current from the main contacts to the arc chutes when breaking currents.

Each contact assembly is fastened to a common driveshaft via an insulated drive link. By rotating this driveshaft, the operating mechanism actuates the contacts of all poles simultaneously. These contacts are quick make and break, under all conditions.

The circuit breaker is of the trip free design in any position of the closing stroke and may be tripped before the contacts touch. While an open operation exists, the moving contacts will return and remain in the open position even if a manual or electrical close operation is maintained. The closing mechanism will not reclose the circuit breaker after such tripping until the closing control circuit is opened and then reclosed.

At the top of the circuit breaker, surrounding each contact structure, is the arc chute assembly. It is designed to extinguish the arc that is drawn when the contacts open.

Each contact assembly is mounted on an insulated panel bolted to the back panel of the circuit breaker's removable element.

The moving contact assembly is designed to make or break a main power circuit by moving onto or out from the fixed main contacts.

Three current sensors are installed. Two current sensors are fixed to the stationary element and surround the lower outer main poles. The third current sensor is fixed to the stationary element and surrounds the top center main pole. These ring-type current transformers are designed to monitor the current and to signal the solid state overcurrent trip device to trip the circuit breaker whenever current exceeds its long time delay and short time pickup settings.

Instantaneous overcurrent trip devices are attached to the two lower outer poles of the circuit breaker. These calibrated devices will trip the circuit breaker whenever the current exceeds the predetermined instantaneous setting.

The operating mechanism transmits the closing force to the drive shaft. It is centrally located in the front of the circuit breaker.

The ON/OFF indicator, located in the front of the circuit breaker, is fastened to the drive shaft above the operating mechanism. This device indicates whether the circuit breaker is open (OFF) or closed (ON).

The trip knob located in the front of the operating mechanism provides a means for tripping the circuit breaker manually.

Anti-rebound catches are provided to prevent reclosing of the contacts when the circuit breaker is tripped. These are mounted on the side plates of the breaker. They also function as shock catches preventing contacts of an open breaker from closing.

The shunt trip circuitry, which acts through the magnetic trip device located on the left side of the operating mechanism assembly, provides the means for electrically tripping the circuit breaker from a remote location with out regard to load conditions in the circuit. Customer supplied 120 Vac Power (standard) is converted to 30 Vdc by a control panel for the magnetic trip device.

The auxiliary switch, actuated by the opening and closing of the circuit breaker, is incorporated to open and close certain contacts in protective and control circuits. The auxiliary switch is linked to the driveshaft which is located above the operating mechanism.

Types ACB 1600/2000HR – 3200/4000HR

ACB 1600/2000HR – 3200/4000HR Breakers, Continued

Directly beneath the operating mechanism is the solenoid closing coil mechanism which provides the closing force for electrical closing of the circuit breaker.

The closing contactor, attached to the left-hand side of the removable element frame, controls the supply of current to the closing coil (customer supplied 450 Vac).

A rectifier unit permits the use of an alternating current source for closing the circuit breaker.

Primary disconnect assemblies are mounted on each phase of the circuit breaker to provide a separable electrical connection between the supply circuit and the circuit breaker.

A movable secondary disconnect assembly, fastened to a channel structure mounted on the bottom rear of the circuit breaker removable element, permits the withdrawal of the circuit breaker without disconnecting the wiring.

An undervoltage trip device (when supplied) mounted to the right-hand side of the mechanism will trip the circuit breaker when the undervoltage coil is de-energized by loss of voltage.

The lockout mechanism prevents the circuit breaker from being racked in or out while the circuit breaker is closed, and prevents closing of the circuit breaker while the removable element is being reached in or out.

The circuit breaker may be racked into or out from the Connected position from or to the Disconnected position by turning the withdrawal mechanism drive shaft which is located on the right of the operating mechanism.

Provision is provided for two indicating lamps. These lamps are only supplied when specified. A “Tripped on overcurrent” lamp is always provided.

NET WEIGHT

DESCRIPTION	NET WEIGHT, LBS. (KG)
2000 A Breaker	318 (144)
2000 A Cassette	180 (82)
4000 A Breaker	658 (299)
4000 A Cassette	495 (225)

Notes

Eaton's Electrical Sector is a global leader in power distribution, power quality, control and automation, and monitoring products. When combined with Eaton's full-scale engineering services, these products provide customer-driven PowerChain Management® solutions to serve the power system needs of the data center, industrial, institutional, public sector, utility, commercial, residential, IT, mission critical, alternative energy and OEM markets worldwide.

PowerChain Management solutions help enterprises achieve sustainable and competitive advantages through proactive management of the power system as a strategic, integrated asset throughout its life cycle, resulting in enhanced safety, greater reliability and energy efficiency. For more information, visit www.eaton.com/electrical.
