The Land Of Tcl/Tk

SQLite

- ACID
- Most of SQL-92
- Zero-configuration
- Single disk file
- Small footprint
(225KiB)
- Cross-platform
databases
- Serverless
- Unlimited length
BLOBs and CLOBs
- Manifest typing
- User-defined
functions
- Fast
- Public Domain

written in and for

SQLite Language Bindings

- Ada
- Basic
- C#
- Delphi
- Eiffel
- Euphoria
- Flash
- Forth
- Fortran
- Haskell
- Java
- Javascript
- Lisp
- Lua
- Ocaml
- Perl
- PHP
- Pike
- Python
- Rebol
- Ruby
- Scheme
- Smalltalk
- Tcl/Tk

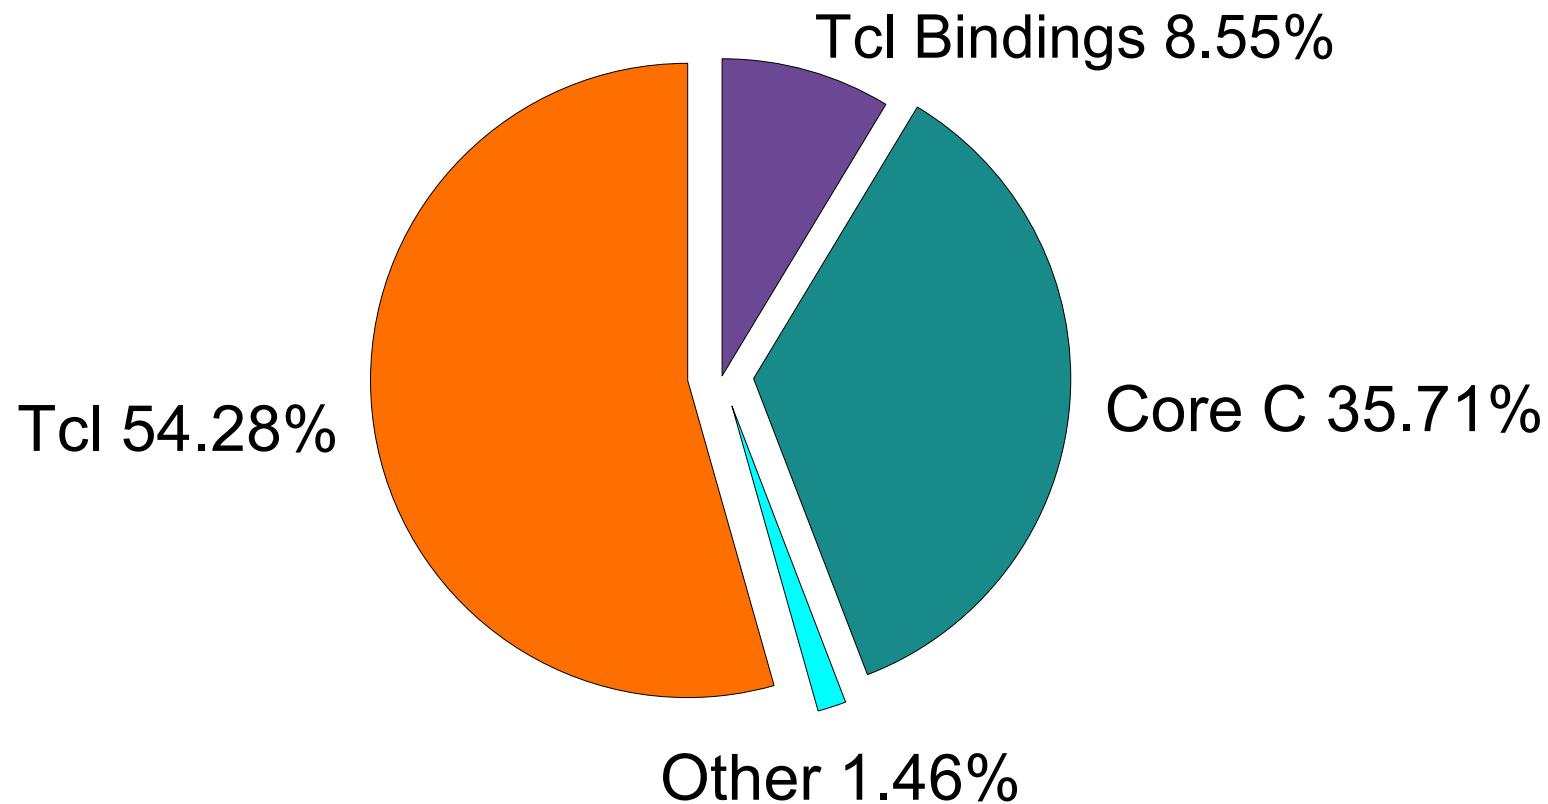

SQLite Language Bindings

- Ada
 - Basic
 - C#
 - Delphi

 - Lisp
 - Lua
 - Ocaml
 - Perl
 - PHP
 - Pike
 - Python
 - Rebol
 - Ruby
 - Scheme
 - Smalltalk
 - Tcl/Tk
- Tcl/Tk is the only binding included in the SQLite source tree**
-
- ```
graph TD; A[Ada] --- B[Basic]; B --- C[C#]; C --- D[Delphi]; D --- E[Eiffel]; E --- F[Euphoria]; F --- G[Flash]; G --- H[Forth]; H --- I[Fortran]; I --- J[Lisp]; J --- K[Lua]; K --- L[Ocaml]; L --- M[Perl]; M --- N[PHP]; N --- O[Pike]; O --- P[Python]; P --- Q[Rebol]; Q --- R[Ruby]; R --- S[Scheme]; S --- T[Smalltalk]; T --- U[TclTk]
```

# Similar Design Philosophy

- Manifest Typing
- No arbitrary limits
- Designed for embedding
- “Just Works”
- Readable source code

# Non-Comment Source Lines In SQLite 3.3.7

GENERAL DYNAMICS

**Microsoft®**

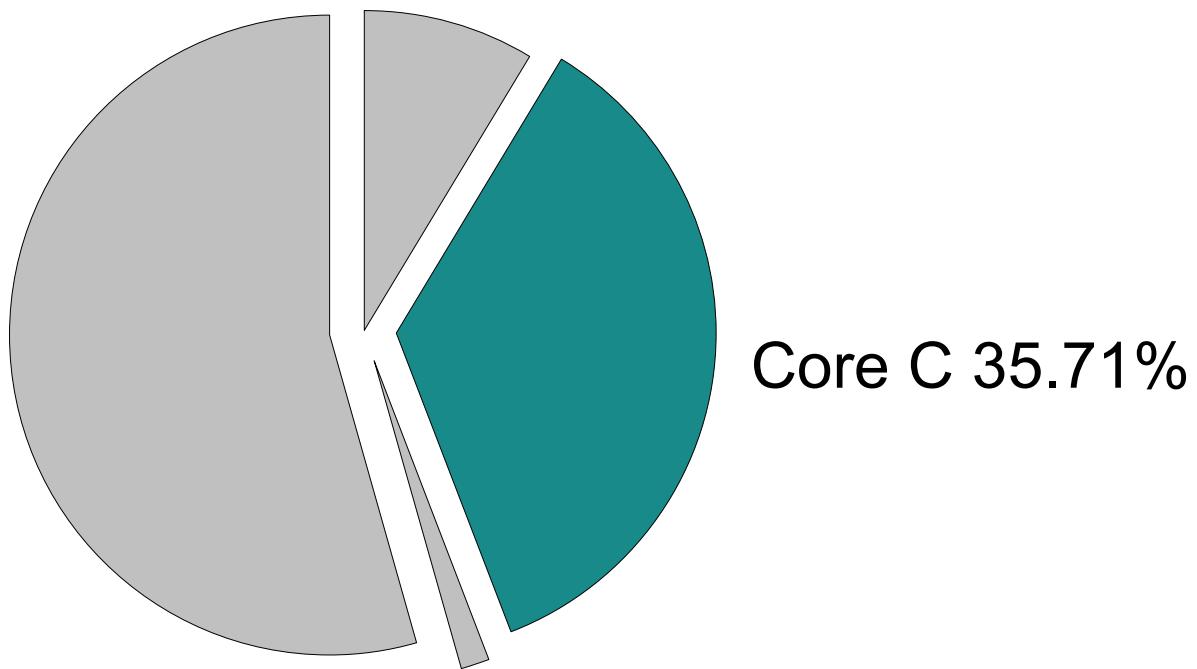

**TOSHIBA**

**symbian**

# Non-Comment Source Lines In SQLite 3.3.7

# Uses For SQLite

- Replacement for client-server RDBMS
- Stand-in for enterprise RDBMS during testing and demos
- Local cache of enterprise RDBMS data
- Persistence of objects, configuration options, etc.
- Complex data structures
- Application file format

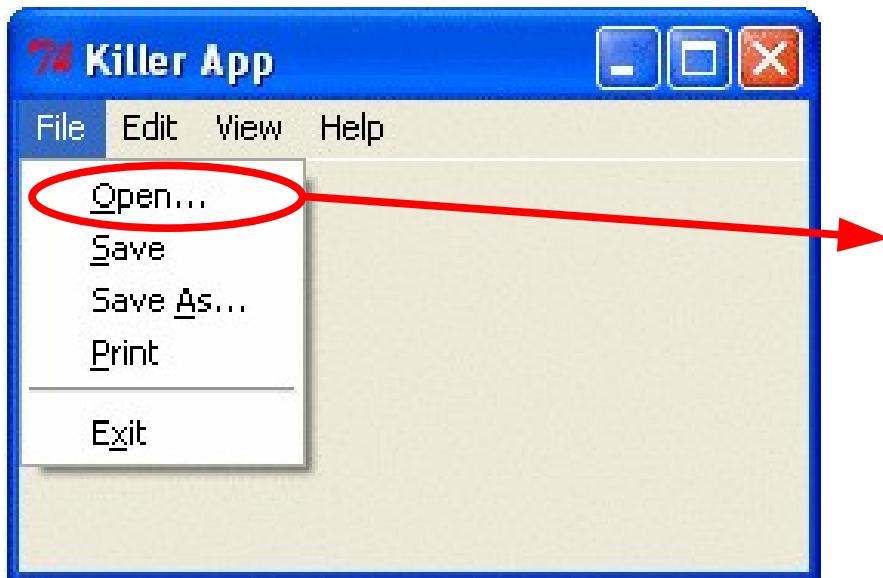

# Uses For SQLite

- Replacement for client-server RDBMS
- Stand-in for enterprise RDBMS during testing and demos
- Local cache of enterprise RDBMS data
- Persistence of objects, configuration options, etc.
- Complex data structures
- Application file format

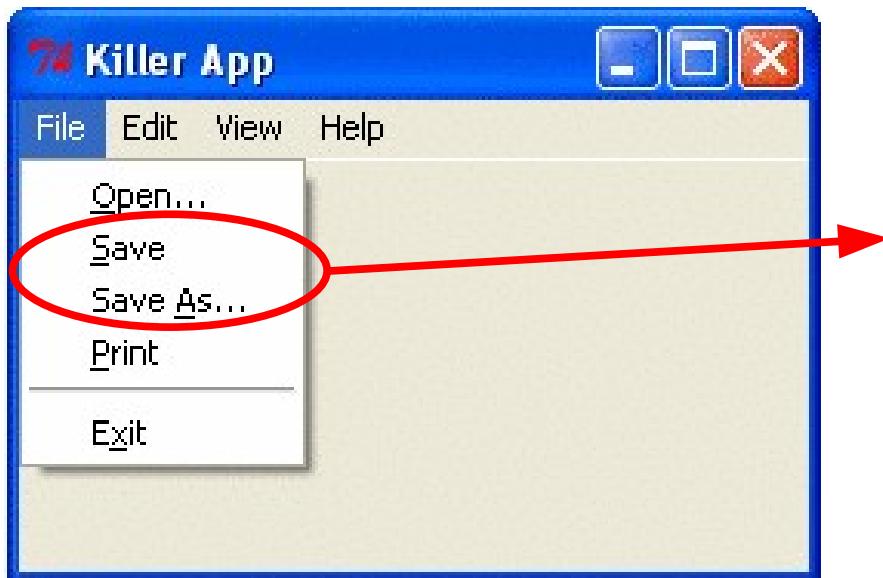

Traditional Uses

Non-traditional Uses

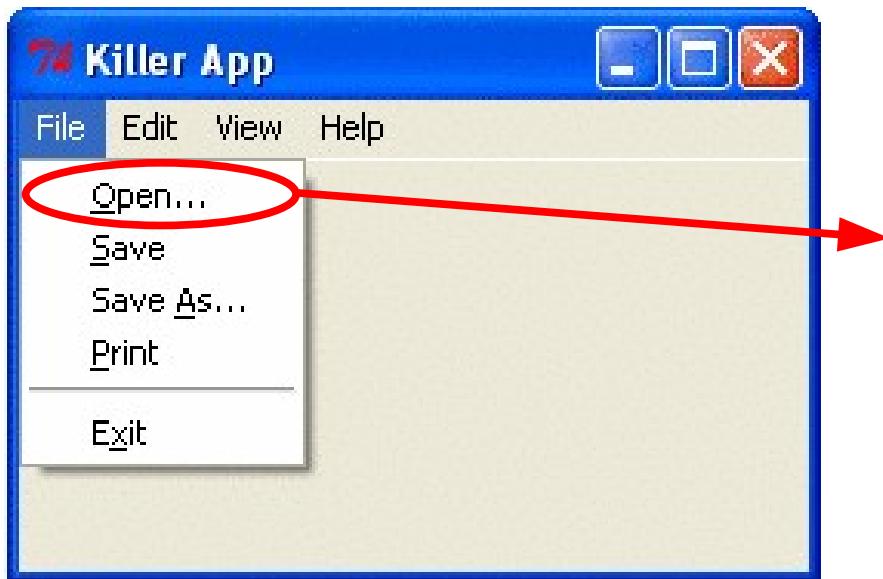

```
set fn [tk_getOpenFile ...]
if {$fn!=""} {
 set fd [open $fn]
 # read and parse
 close $fd
}
```

- File/Open reads and parses the entire application file
- Error prone
- Lots of code to maintain
- Application crash causes data loss

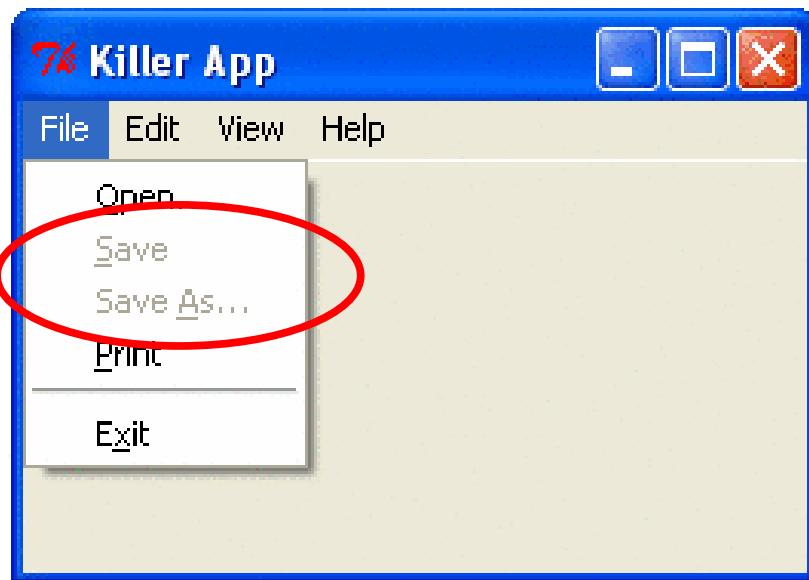

```
set fn [tk_getSaveFile ...]
if {$fn!=""} {
 set fd [open $fn w]
 # Write the file
 close $fd
}
```

- Requires the user to remember to save
- Possible overwrite of independent changes
- Corruption if file generator and parser do not match

```
set fn [tk_getOpenFile ...]
if {$fn!=""} {
 sqlite3 db $fn
}
```

- No need to read and parse file content
- Updates are atomic, consistent, isolated, and durable
- Automatic concurrency control

- Changes are written to disk immediately
- No data loss after unexpected power failure
- The Save and Save As options are obsolete – remove them.

# Key Concept

SQLite wants to replace  
fopen() not Oracle

# Key Concept

SQLite wants to replace  
[open] not oratcl

Go here

The screenshot shows a Mac OS X-style web browser window titled "SQLite Download Page". The address bar contains the URL <http://www.sqlite.org/download.html>. A red oval highlights the address bar area, and a red arrow points from the text "Go here" at the top right towards it. Below the address bar, the menu bar includes "File", "Edit", "View", "Search", "Window", and "Help". The main content area displays download links for SQLite 3.3.8:

- sqlite-source-3\_3\_8.zip (586.44 KiB)**: This ZIP archive contains pure C source code for the SQLite library. Unlike the tarballs below, all of the preprocessing and automatic code generation has already been done on these C source code, so they can be processed directly with any ordinary C compiler. This file is provided as a service to MS-Windows users who lack the build support infrastructure of Unix.
- sqlite-3\_3\_8-tea.tar.gz (672.73 KiB)**: A tarball of proprocessed source code together with a Tcl Extension Architecture (TEA) compatible configure script and makefile.

**Cross-Platform Binaries**

- sqlite-3\_3\_8.kit (769.50 KiB)**: A [starkit](#) containing precompiled SQLite binaries and Tcl bindings for Linux-x86, Windows, and Mac OS-X. A red oval highlights this link, and a red arrow points from the text "Get this" at the top right towards it.

**Direct Access To The Sources Via Anonymous CVS**

All SQLite source code is maintained in a [CVS](#) repository that is available for read-only

**SQLite Download Page**

<http://www.sqlite.org/download.html>

sqlite-source-  
3\_3\_8.zip  
(586.44 KiB)

This ZIP archive contains pure C source code for the SQLite library. Unlike the tarballs below, all of the preprocessing and automatic code generation has already been done on these C source code, so they can be processed directly with any ordinary C compiler. This file is provided as a service to MS-Windows users who lack the build support infrastructure of Unix.

sqlite-3\_3\_8-  
tea.tar.gz  
(672.73 KiB)

A tarball of proprocessed source code together with a Tcl Extension Architecture (TEA) compatible configure script and makefile.

**Cross-Platform Binaries**

sqlite-3\_3\_8.kit  
(769.50 KiB)

A starkit containing precompiled SQLite binaries and Tcl bindings for Linux-x86, Windows, and Mac OS-X.

**Or get this and do  
configure/make install**

**Direct Access To The Sources Via Anonymous CVS**

All SQLite source code is maintained in a [CVS](#) repository that is available for read-only

```
% source sqlite-3_3_8.kit
% package require sqlite3
3.3.8
% sqlite3 db database.db
%
```

New object for  
controlling the database

Can be omitted if SQLite  
is installed on your system

Name of the database file.  
A new one is created if it does  
not already exist.

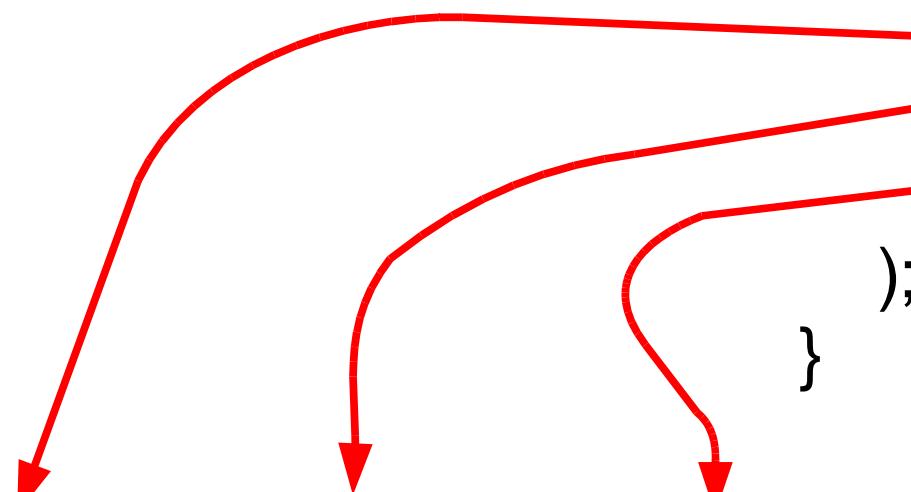

Use the “eval” method to run SQL

```
db eval {
 CREATE TABLE users(
 userid INTEGER,
 first_name VARCHAR(30),
 last_name VARCHAR(40)
);
}
```

| user | first_name | last_name |
|------|------------|-----------|
|      |            |           |
|      |            |           |
|      |            |           |
|      |            |           |

Semicolon separates multiple  
SQL statements.  
Final semicolon is optional.

```
db eval {
 CREATE TABLE users(
 userid INTEGER,
 first_name VARCHAR(30),
 last_name VARCHAR(40)
);
}
```

| user | first_name | last_name |
|------|------------|-----------|
|      |            |           |
|      |            |           |
|      |            |           |
|      |            |           |

```
db eval {
 CREATE TABLE users(
 userid INTEGER,
 first_name VARCHAR(30),
 last_name VARCHAR(40)
);
}
```

Fixed set of columns

The diagram illustrates a database table structure. At the top, a red arrow points from the text "Fixed set of columns" down to a horizontal bracket spanning three columns: "user", "first\_name", and "last\_name". Below this, a vertical red bracket on the right side groups four rows of data. The table has a green header row and four data rows. The columns are labeled "user", "first\_name", and "last\_name". The data rows are empty, representing an "Arbitrary number of rows".

| user | first_name | last_name |
|------|------------|-----------|
|      |            |           |
|      |            |           |
|      |            |           |
|      |            |           |

Arbitrary number of rows

```
db eval {
 CREATE TABLE users(
 userid INTEGER,
 first_name VARCHAR(30),
 last_name VARCHAR(40)
);
}
```

| user | first_name | last_name |
|------|------------|-----------|
|      |            |           |
|      |            |           |
|      |            |           |
|      |            |           |

Datatypes are ignored, mostly

**Use an INSERT statement to add data**

```
db eval {
 INSERT INTO users
 VALUES(1, 'D. Richard', 'Hipp')
}
```

**Better to specify column names**

```
db eval {
 INSERT INTO users(user,first_name,last_name)
 VALUES(1, 'D. Richard', 'Hipp')
}
```

**Columns can occur in any order**

```
db eval {
 INSERT INTO users(last_name, user, first_name)
 VALUES('Hipp', 1, 'D. Richard')
}
```

```
db eval {
 INSERT INTO users
 VALUES(1, 'D. Richard', 'Hipp')
}
```

| user | first_name | last_name |
|------|------------|-----------|
| 1    | D. Richard | Hipp      |
|      |            |           |
|      |            |           |
|      |            |           |

Use a SELECT statement to extract data from the database

```
% db eval {
 SELECT *
 FROM users
}
1 {D. Richard} Hipp
%
```

“\*” means get all columns

```
% db eval {
 SELECT *
 FROM users
}
1 {D. Richard} Hipp
%
```

Data returned in a T CL list

Better to specify specific column names  
rather than use “\*”

```
% db eval {
 SELECT user, first_name, last_name
 FROM users
}
1 {D. Richard} Hipp
%
```

```
db eval {
 INSERT INTO users
 VALUES(2, 'Ginger', 'Wyrick')
}
```

| user | first_name | last_name |
|------|------------|-----------|
| 1    | D. Richard | Hipp      |
| 2    | Ginger     | Wyrick    |
|      |            |           |
|      |            |           |

```
% db eval {
 SELECT * FROM users
}
1 {D. Richard} Hipp 2 Ginger Wyrick
%
```

Additional rows of data just  
make the returned list longer

```
% db close
```

```
% rename db {}
```

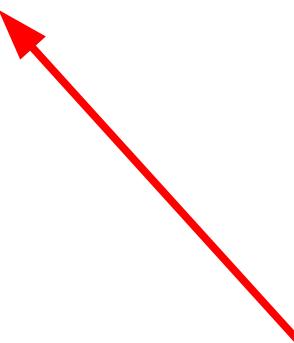

**T hese do the same thing**

```
% sqlite3 db database.db
% db eval {SELECT * FROM user} {
 puts userid=$userid
 puts "name=$first_name $last_name"
}
userid=1
name=D. Richard Hipp
userid=2
name=Ginger Wyrick
%
```

Script runs once for each row in result set

Column contents store in TCL variables

```
% sqlite3 db database.db
% foreach {userid first_name last_name} \
 [db eval {SELECT * FROM user}] {
 puts userid=$userid
 puts "name=$first_name $last_name"
}
userid=1
name=D. Richard Hipp
userid=2
name=Ginger Wyrick
%
```

Similar to the previous  
except entire result set  
is held in memory here

```
% sqlite3 db database.db
% db eval {SELECT * FROM user} {
 puts userid=$userid
 puts "name=$first_name $last_name"
 break
}
userid=1
name=D. Richard Hipp
%
```

**“break” and “continue” work  
in the usual way**

```
% db eval {SELECT * FROM user} break
```

```
% set userid
```

```
1
```

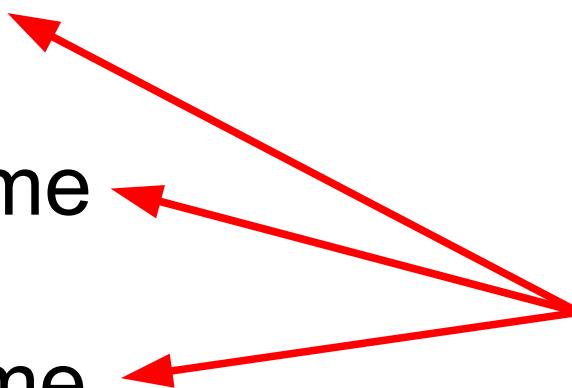

```
% set first_name
```

```
D. Richard
```

```
% set last_name
```

```
Hipp
```

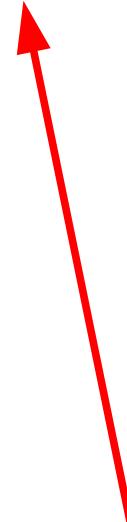

```
%
```

Variables persist after  
the last iteration of the  
loop

```
% db eval {SELECT * FROM user} var {
 puts userid=$var(userid)
 puts "name=$var(first_name) $var(last_name)"
}
userid=1
name=D. Richard Hipp
userid=2
name=Ginger Wyrick
%
```

```
% db eval {SELECT * FROM user} var break
% parray var
var(*) = userid first_name last_name
var(first_name) = D. Richard
var(last_name) = Hipp
var(userid) = 1
%
```

List of result set column names

Use AS to specify alternative column names  
in the result set

```
% db eval {
 SELECT user AS id, first_name AS fname,
 last_name AS lname
 FROM user} var break
```

```
% parray var
```

```
var(*) = id fname lname
```

```
var(fname) = D. Richard
```

```
var(lname) = Hipp
```

```
var(id) = 1
```

```
%
```

```
db eval {
 ALTER TABLE user
 ADD COLUMN picture;
}
```

| user | first_name | last_name | picture |
|------|------------|-----------|---------|
| 1    | D. Richard | Hipp      |         |
|      |            |           |         |
|      |            |           |         |
|      |            |           |         |

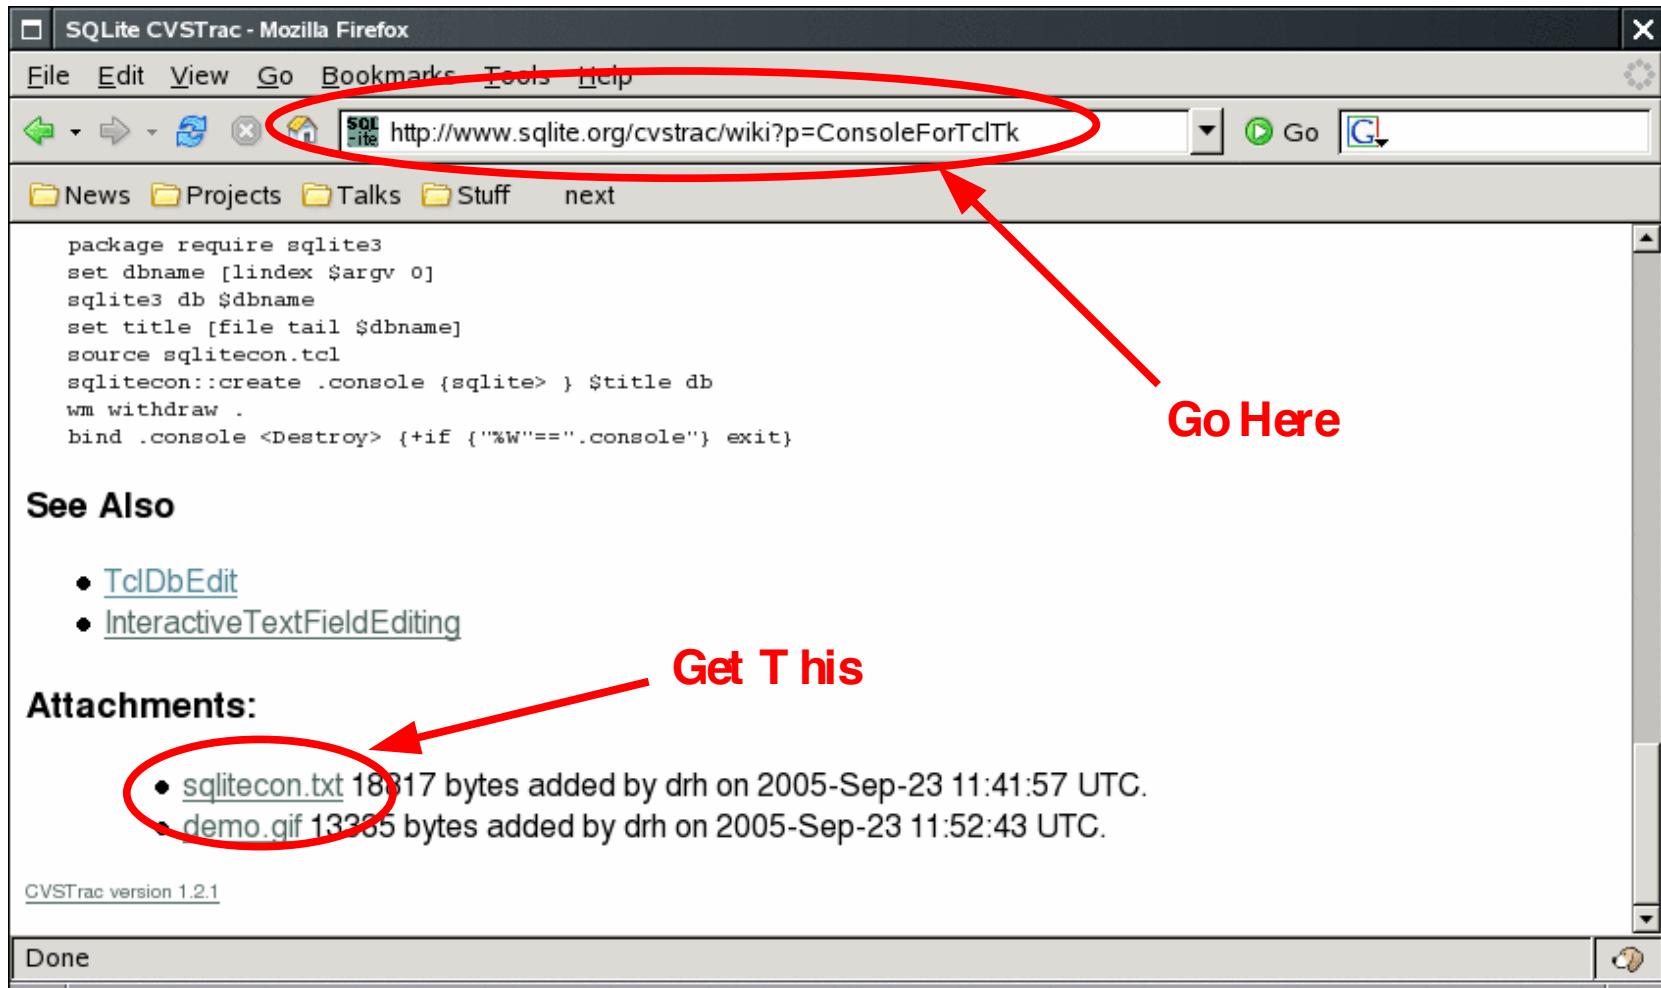

New Column Added

```
% set in [open drh.jpg]
% fconfigure $in -translation binary
% set drhphoto [read $in]
% close $in
% db eval {
 UPDATE user
 SET picture=$drhphoto
 WHERE user=1
```

}

%

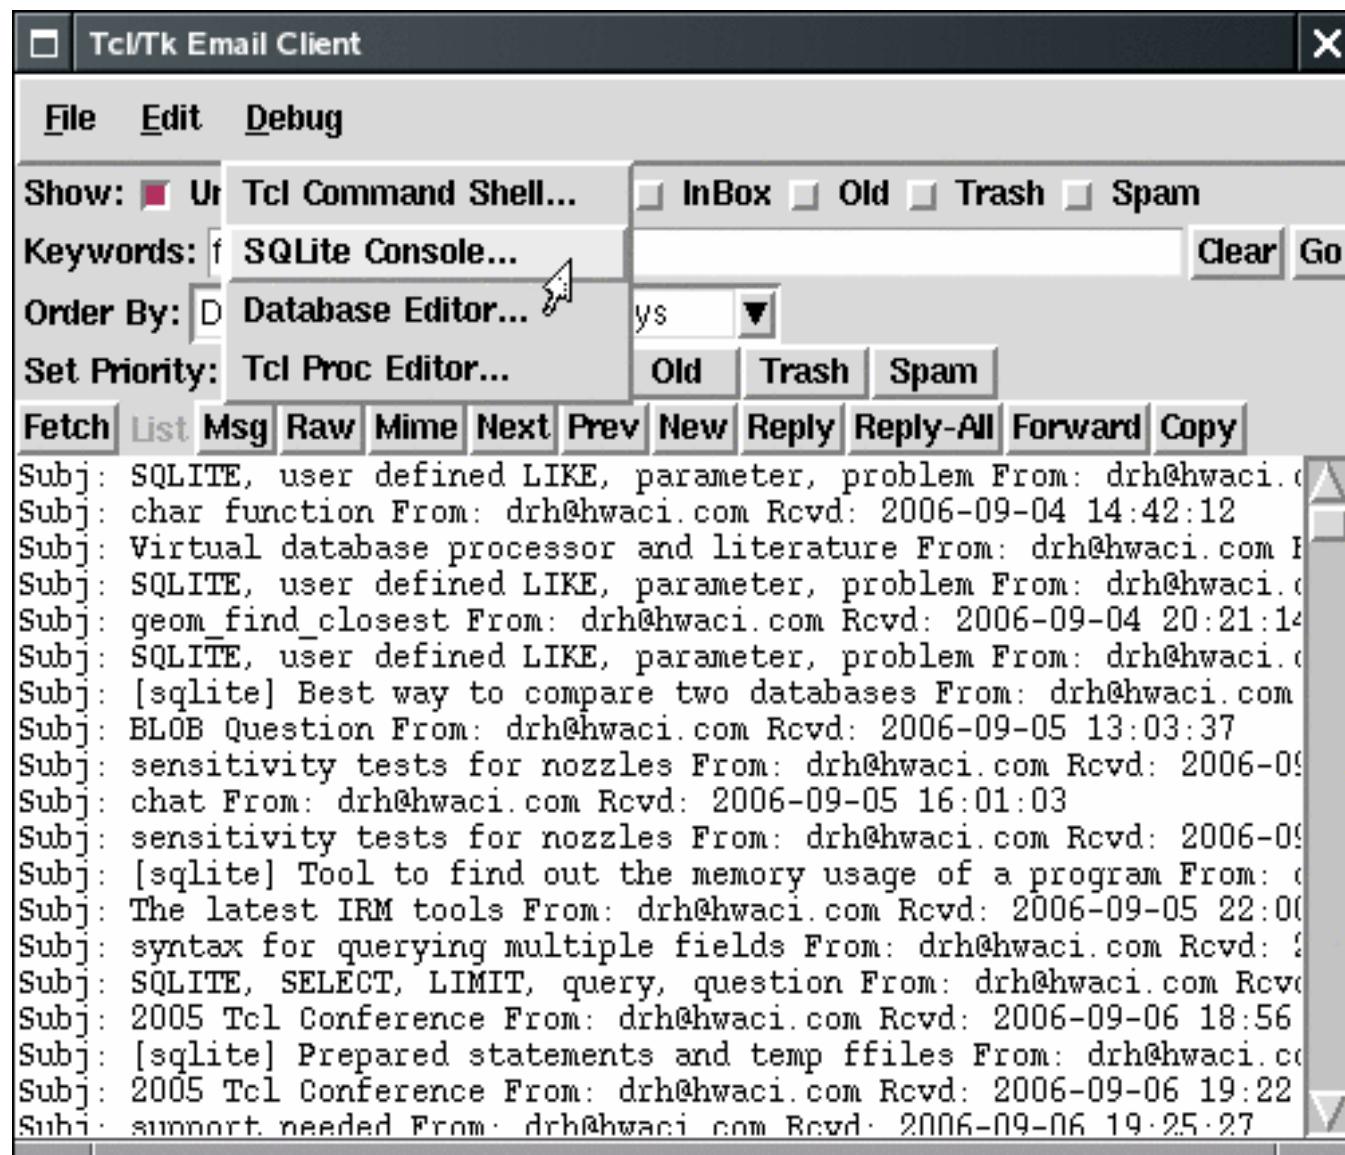

**Note the use of curly-braces,  
not double-quotes**

```
% package require Tk
% source sqlitecon.txt
% sqlitecon::create .console {sqlite>} test.db db
%
```

The screenshot shows a terminal window titled "test.db". The window has a menu bar with "File" and "Edit". The main area contains the following SQLite session:

```
sqlite> .tables
t1
sqlite> .schema
CREATE TABLE t1(a,b,c)
sqlite> select * from t1;
a b c
-
1 2 3
sqlite> create table t2 as select c, b, a from t1;
sqlite> .tables
t1 t2
sqlite> .schema
CREATE TABLE t1(a,b,c)
CREATE TABLE t2(c,b,a)
sqlite> select * from t2;
c b a
-
3 2 1
sqlite> |
```

# Full Text Search

**Q:** What is Full Text Search?

- 
- **A:** In brief: what Google does.

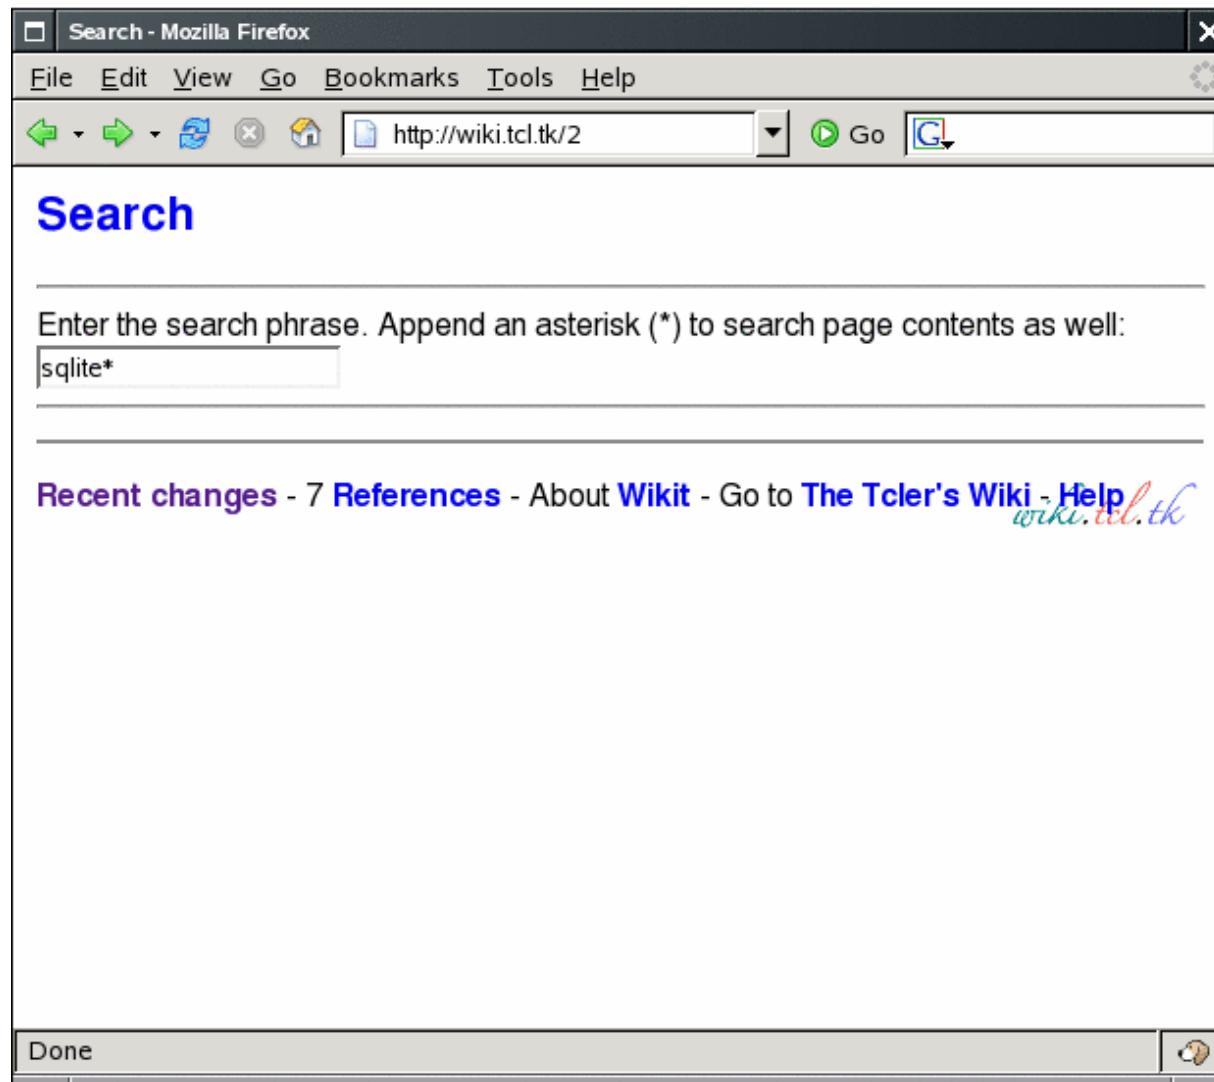

# Full Text Search

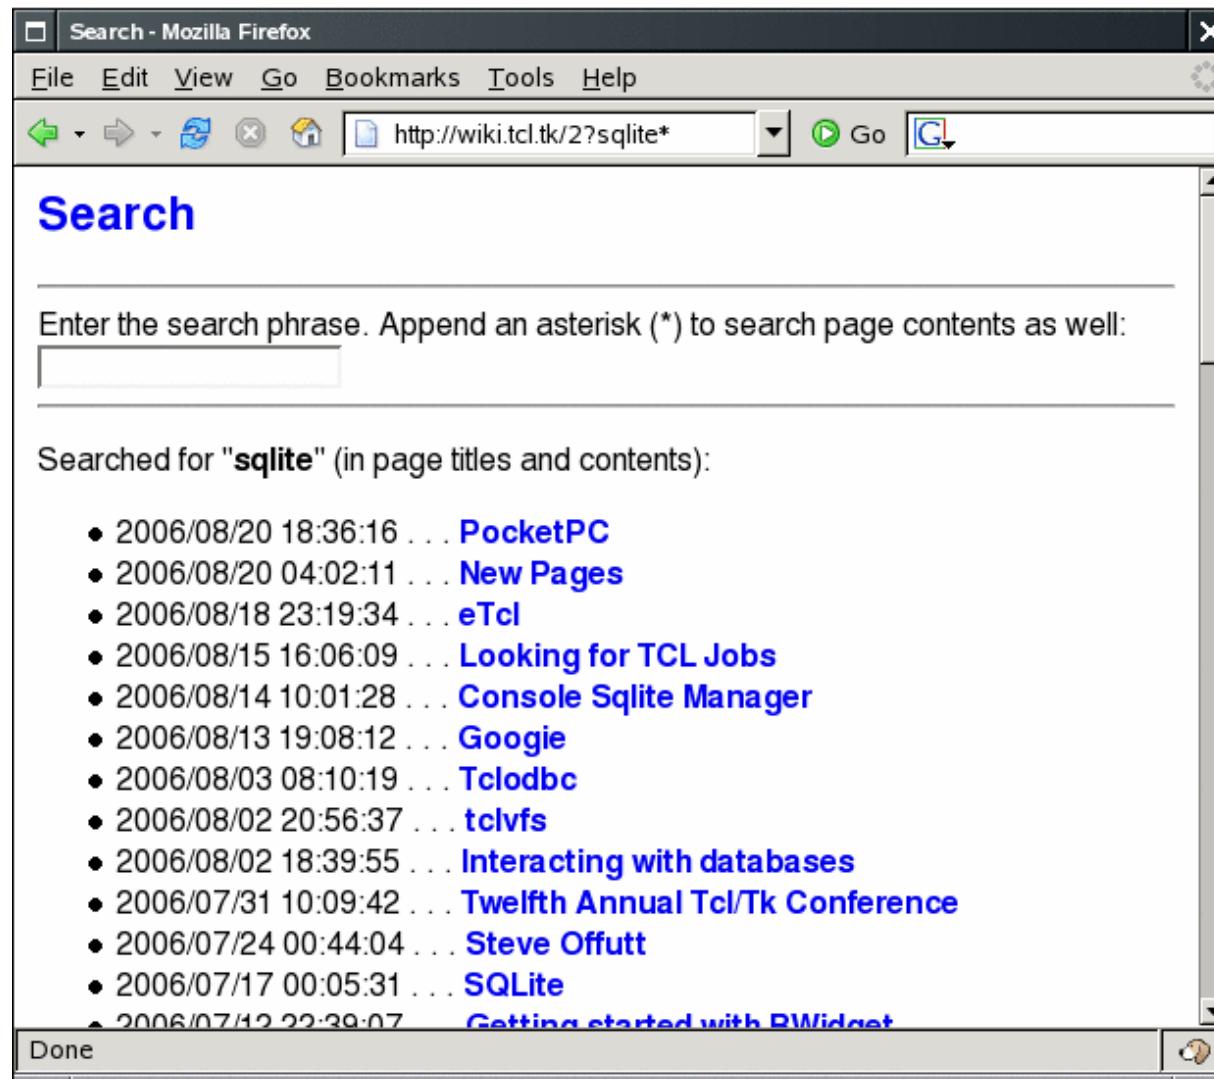

- **Q:** Why is full text search important?
- 
- **A:** Internet search engines have users spoiled.  
Modern applications need to support full text search in order to be competitive

# Full Text Search

- **Q:** Is it difficult to implement?
- 
- **A:** It is tricky to make it efficient for large data sets and getting internationalization right is hard

# Single Term Search

# Multiple Term Search

Two or more  
search terms  
per query

A screenshot of a Yahoo! search results page titled "sqlite postgresql - Yahoo! Search Results". The search bar at the top contains the query "sqlite postgresql". Below the search bar, the page title is "YAHOO! SEARCH". The main content area is titled "Search Results" and shows 1 - 10 of about 1,130,000 results for the query. The results are listed in a numbered list:

1. [SQLite Database Speed Comparison](#)  
... the synchronous SQLite times are for comparison against PostgreSQL (which is ... Prior versions of SQLite used to be slower than PostgreSQL and MySQL on this ...  
[www.sqlite.org/speed.html](http://www.sqlite.org/speed.html) - 21k - [Cached](#) - [More from this site](#) - [Save](#)
2. [sqlite: A command-line access program for SQLite databases](#)  
... PostgreSQL, so you can also use the .dump command to export an SQLite database ... way and export a PostgreSQL database into SQLite using the pg\_dump utility. ...

- Mel's Internet Toolkit**  
Get a List back: set result [tk::db::**sqlite**::query "select \* from users" Get an array back: tk::db::**sqlite**::query:v -variable myvar "select \* from users" ...  
[wiki.tcl.tk/15363](http://wiki.tcl.tk/15363) - 9k - [Cached](#) - [Similar pages](#)

The results also include links for "The Cool Store" and "The repository is runtime agnostic. You can develop...".

# Proximity search

- Some search engines allow queries like this:
  - sqlite NEAR postgresql
- Matches when “sqlite” occurs near (within 10 words of) “postgresql” in the document
- No more technically difficult than a phrase search

# Elements Of Full Text Search

- Tokenizing
- Lexicon mapping
- Indexing and querying
- Snippet generation
- Scoring

# SQLite

---

SQLite 是個超輕量級的資料庫程式,因為我想在NB上寫Rails,但是又不想裝MySQL好重,第一個就想到SQLite。關於SQLite的中文介紹,可以參考 [簡介SQLite](#) 和 [SQLite使用教學](#)。基本上 sqlite 就是一隻 command-line 程式而已,再加上一個資料檔(即一個資料庫)。

要在Rails中使用,首先去 [SQLite](#) 網站下載執行檔 跟 DLL檔,即 sqlite3.exe 跟 sqlite3.dll,放到 C:/ruby/bin 下。

接著安裝 sqlite for Ruby gem,執行 gem install sqlite3-ruby,並選擇 win32 的版本。

最後設定 database.yml :

```
Done
```

<p><a href="http://www.sqlite.org/index.html">  
</a>  
</p>

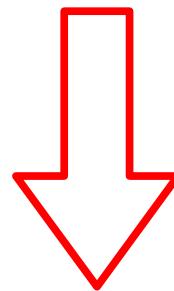

<p>SQLite 是個超輕量級的資料庫程式，因為我想在 NB 上寫 Rails，

# Queries

**recommend new book**

**Retrieve posting lists for each word in the query**

**recommend:** doc1872, doc2351

**new:** doc11, doc31, doc35, ..., doc2337, doc2351

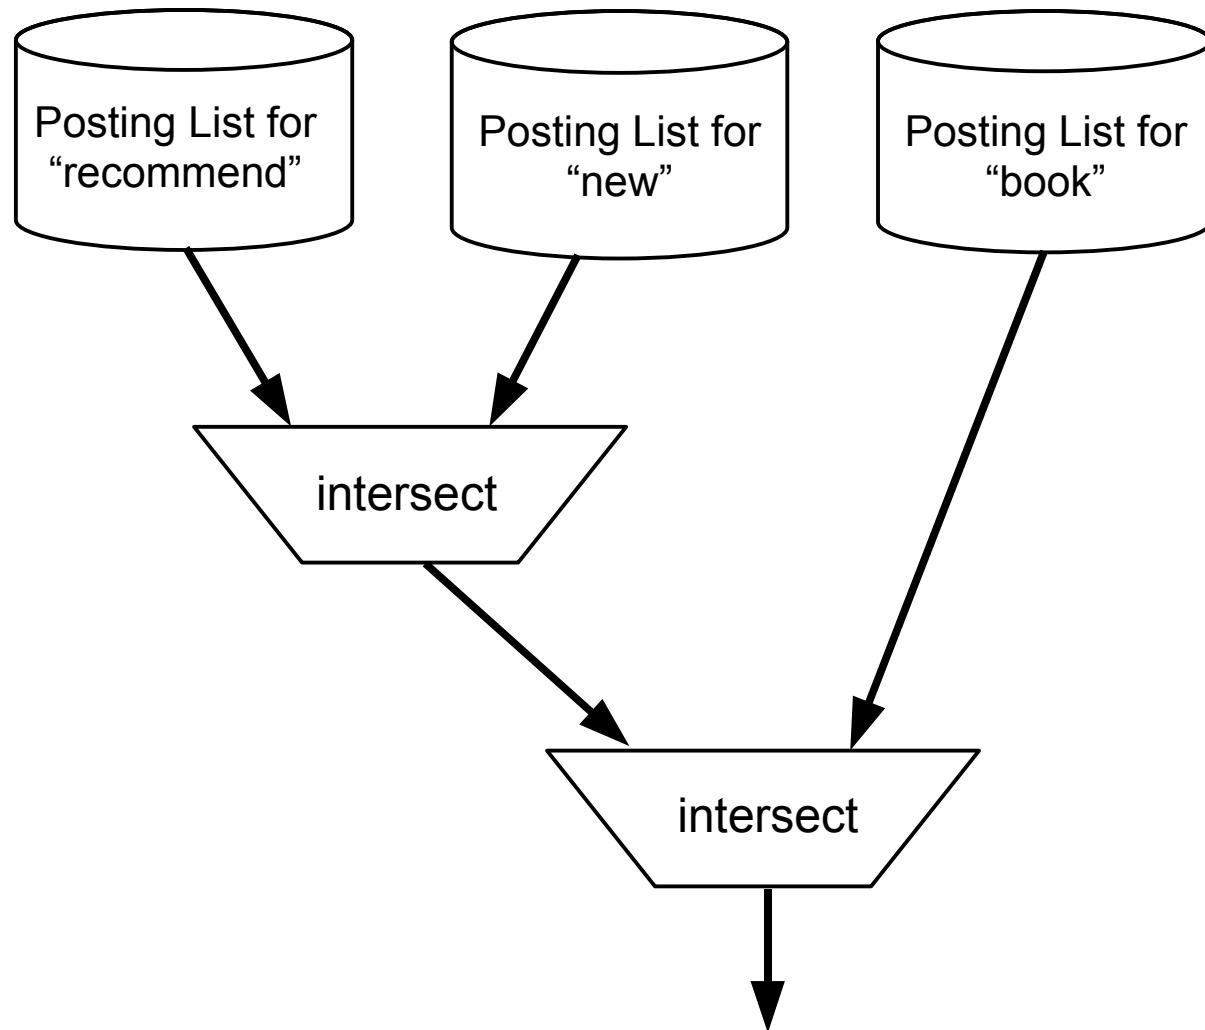

**book:** doc192, doc331, doc409, ..., doc2196, doc2351

**Take the intersection of the posting lists**

doc2351

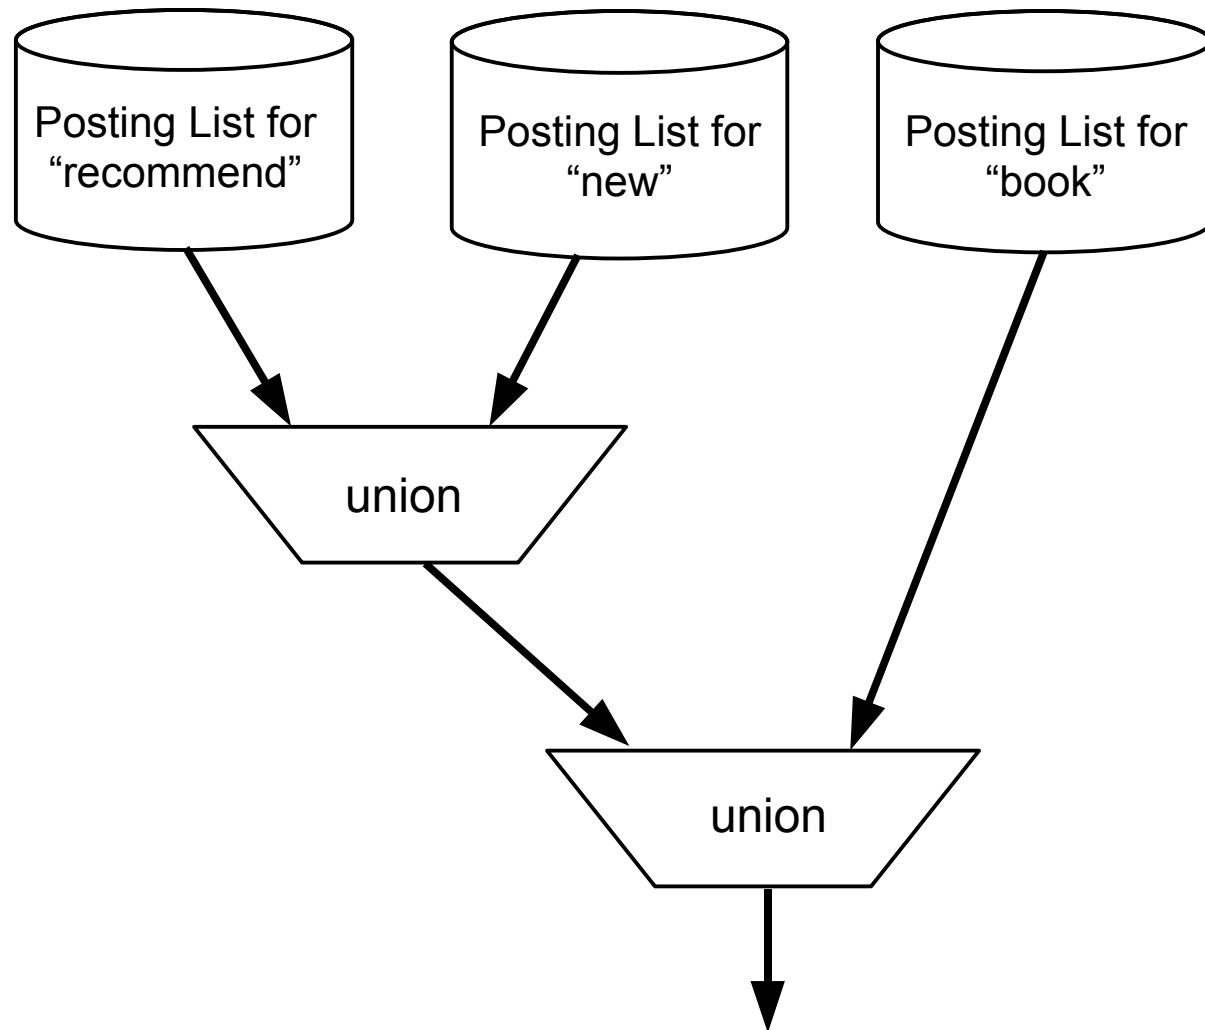

## **recommend new book**

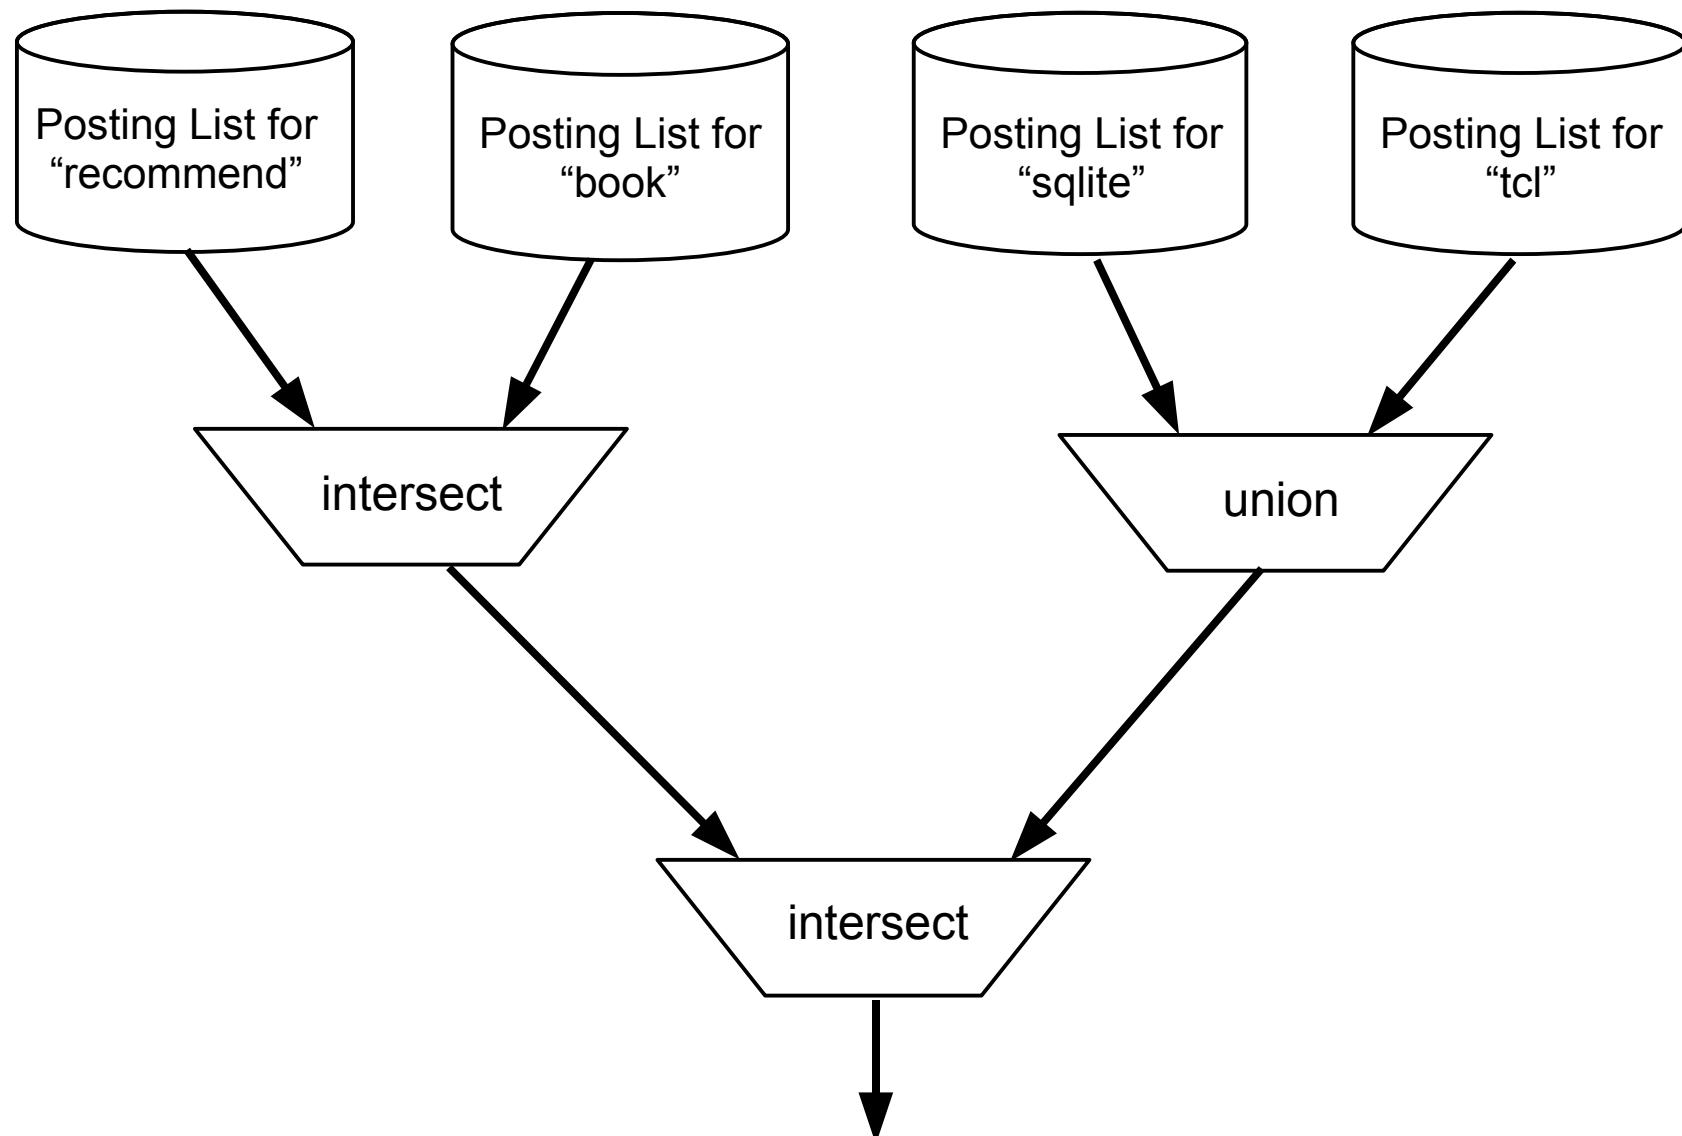

# OR Queries

- Simply take the union of the posting lists instead of the intersection

## **recommend OR new OR book**

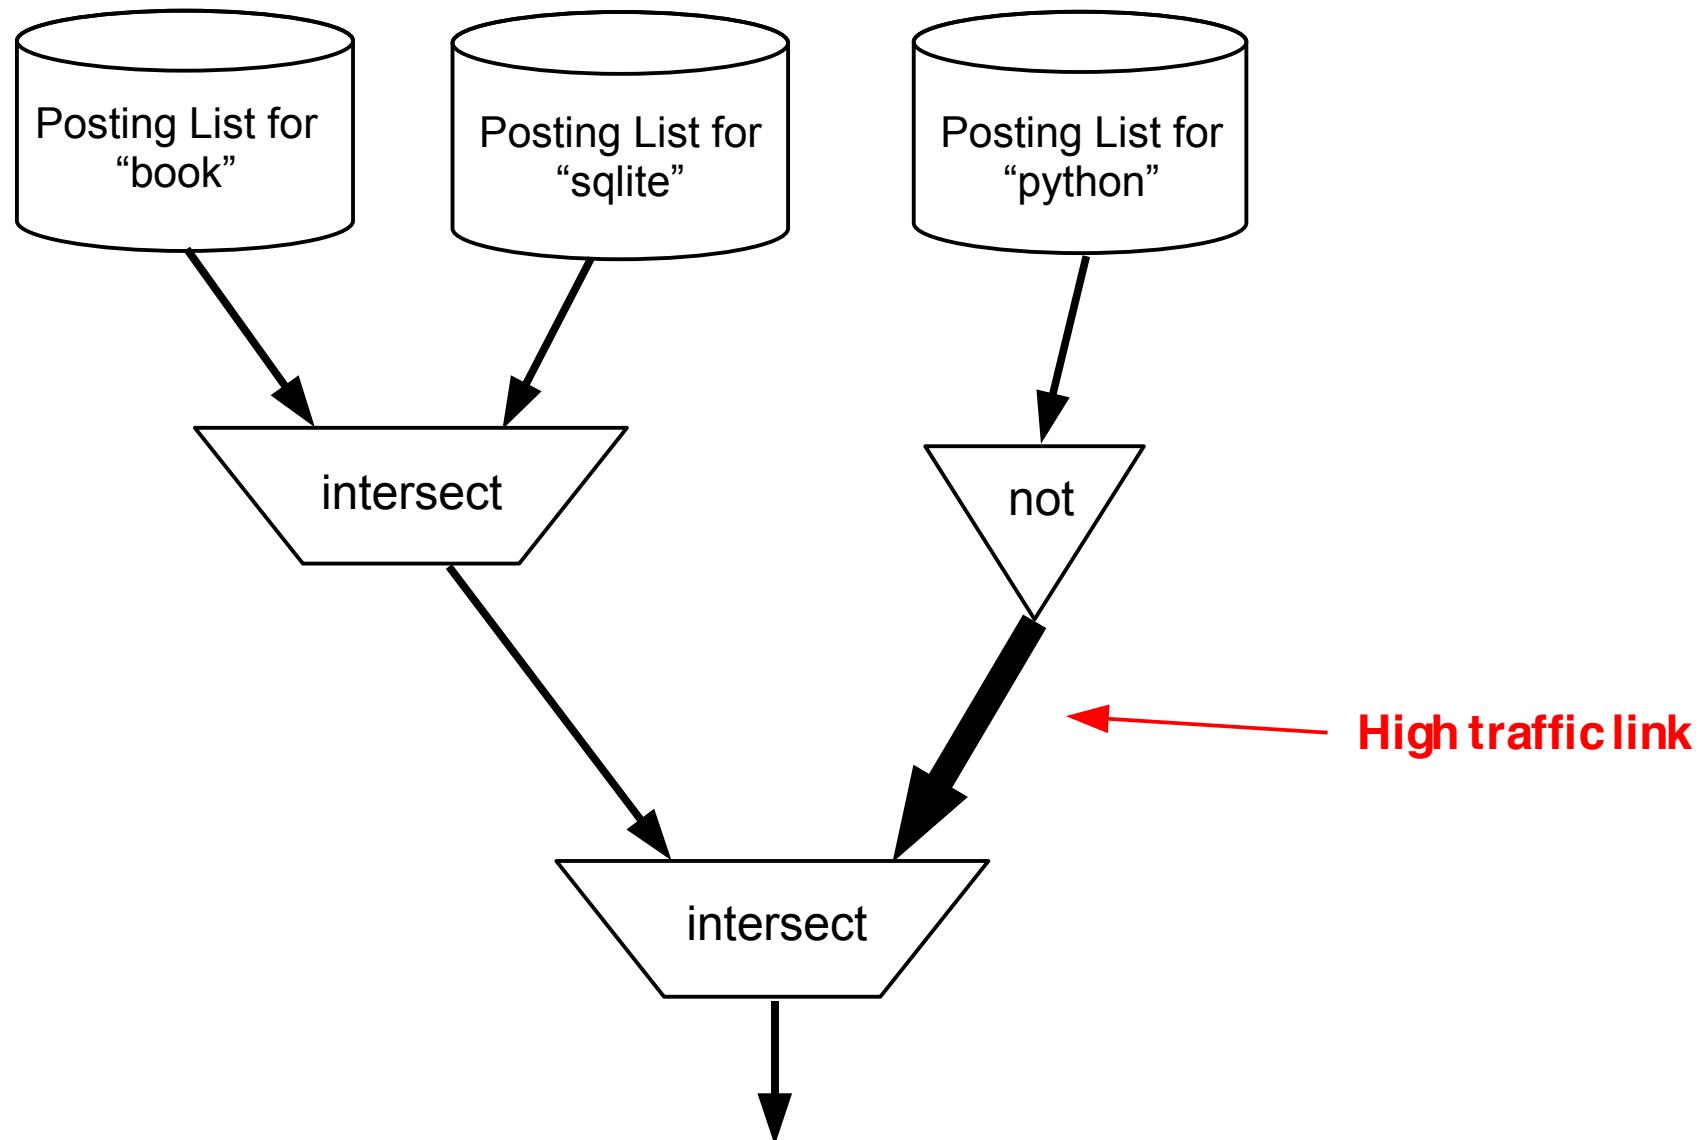

## **recommend book (sqlite OR tcl)**

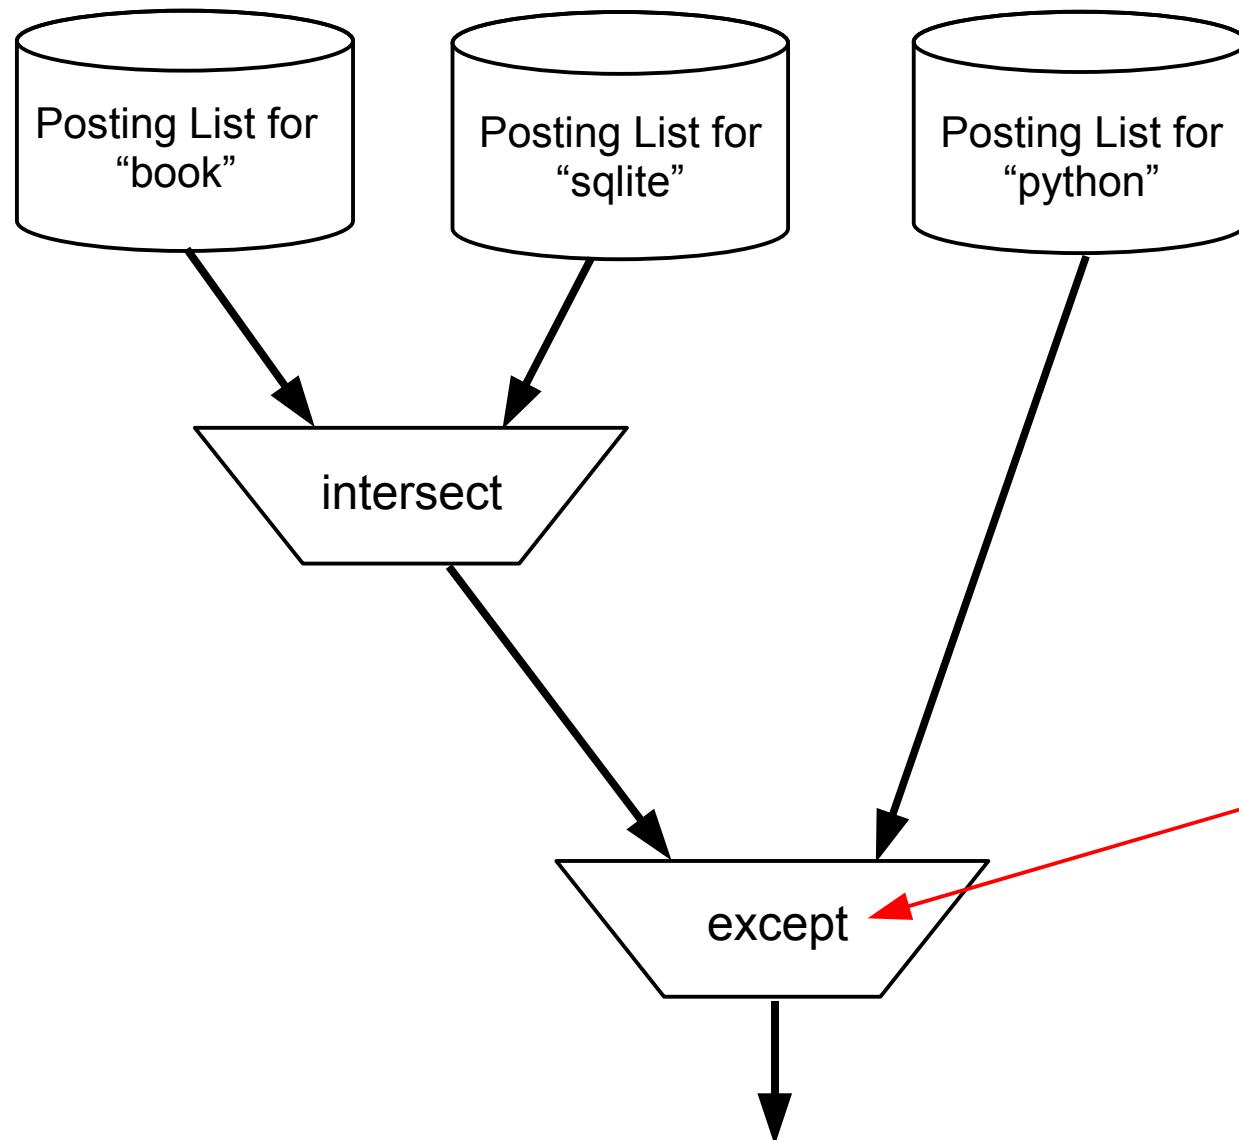

# NOT Queries

- Use the complement of the posting list
  -
- Or better, use an “except” operator

**book sqlite -python**

**book sqlite -python**

Works just like the  
EXCEPT operator  
in SQL

# Phrase Queries

(naïve method)

- Do an ordinary AND query, then examine every document in the result set in a second pass and eliminate those that lack the phrase

# Consider this phrase query:

- “the and but”

■  
■  
■

**recommend:** doc1872:17, [doc2351:48](#)

**“new book” (sqlite OR tcl)**

# Basic Operations

## 1. Insert A New Document:

- Break the document up into words
- Append the document ID to the posting list for each word

## 2. Perform A Query:

- Lookup the posting list for each word in the query
- Combine posting lists

What's so hard about that?

# Appending DocIDs to Posting Lists

- Average email contains about 200 unique words
- Compressed posting lists measure about 20-30% of the size of the original documents.
- A multi-gibibyte index will not fit in cache
- Each word lookup will require at least one revolution of the disk platter: 8ms
- Total time to insert one email: 1.6 seconds

To get good performance, you need to keep  
your working set smaller than our cache

---

The working set for a full-text index can get  
really big really fast

# Keeping The Working Set Small

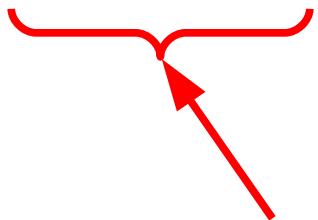

- Limit size of the lexicon
  - Stemming
  - Stop words
- Compress the posting lists aggressively
- Spill stationary parts of posting lists into a separate table that is not cached

# Full Text Search

in

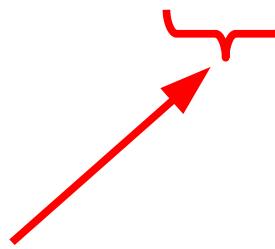

**CREATE VIRTUAL TABLE email USING fts1(content);**

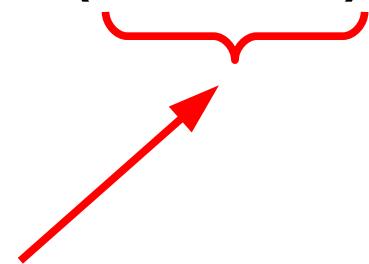

Looks and acts like a table  
but is not really a table.

**CREATE VIRTUAL TABLE email USING fts1(content);**

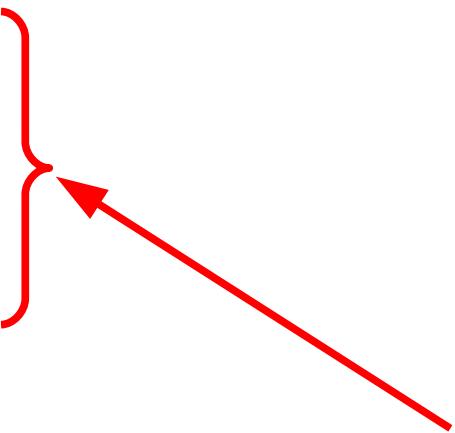

Implemented using the “fts1”  
module.

**CREATE VIRTUAL TABLE email USING fts1(content);**

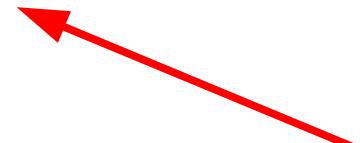

Stores and indexes a single column named “content”.

```
CREATE VIRTUAL TABLE email USING fts1(
 "from" TEXT,
 "to" TEXT,
 subject TEXT,
 body TEXT
);
```

Able to index multiple columns.

```
CREATE VIRTUAL TABLE email USING fts1(
 “from” TEXT,
 “to” TEXT,
 subject TEXT,
 body TEXT,
 tokenize porter 
);
```

Use the Porter stemmer.

```
db eval {
 INSERT INTO email(rowid,[from],[to],subject,body)
 VALUES($msgid,$from,$to,$subj,$body)
}
```

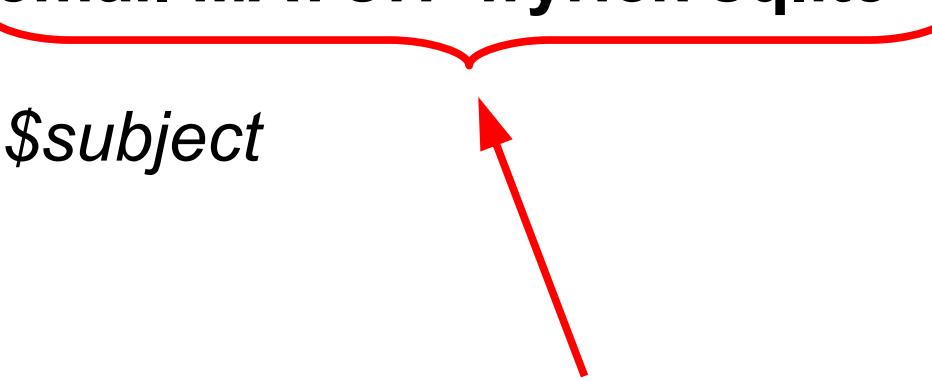

Insert just like a regular table

```
db eval {
 DELETE FROM email WHERE rowid=$msgid
}
```

Delete works the same, too

```
db eval {
 SELECT rowid, subject FROM email
 WHERE email MATCH 'wyrick sqlite'
} {
 # Display $subject
}
```

Full-text search query using the  
MATCH clause.

```
db eval {
 SELECT rowid, subject FROM email
 WHERE email MATCH 'wyrick sqlite'
} {
 ...
}
```

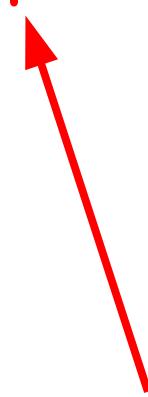

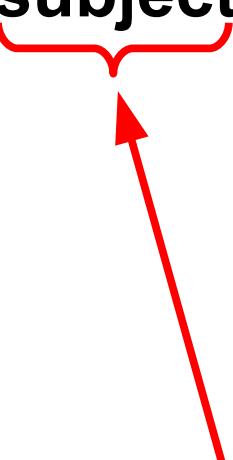

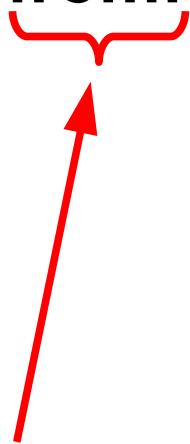

Table name as left operand means  
match against any column of the table

```
db eval {
 SELECT rowid, subject FROM email
 WHERE subject MATCH 'wyrick sqlite'
} {
 ...
}
```

Use a particular column name to limit  
the search to that one column

```
db eval {
 SELECT rowid, subject FROM email
 WHERE email MATCH 'from:wyrick sqlite'
} {
 ...
}
```

Qualifiers limit an individual search term  
to a particular column

Built-in snippet generator

```
db eval {
 SELECT rowid, snippet(email) FROM email
 WHERE email MATCH 'from:wyrick sqlite'
}
{
...
}
```

**SQLite Download Page**

<http://www.sqlite.org/download.html>

sqlite-source-  
3\_3\_8.zip  
(586.44 KiB)

This ZIP archive contains pure C source code for the SQLite library. Unlike the tarballs below, all of the preprocessing and automatic code generation has already been done on these C source code, so they can be processed directly with any ordinary C compiler. This file is provided as a service to MS-Windows users who lack the build support infrastructure of Unix.

sqlite-3\_3\_8-  
tea.tar.gz  
(672.73 KiB)

A tarball of proprocessed source code together with a Tcl Extension Architecture (TEA) compatible configure script and makefile.

**Cross-Platform Binaries**

sqlite-3\_3\_8.kit  
(769.50 KiB)

A starkit containing precompiled SQLite binaries and Tcl bindings for Linux-x86, Windows, and Mac OS-X.

**FT S1 comes standard with T CL bindings**

**Direct Access To The Sources Via Anonymous CVS**

All SQLite source code is maintained in a CVS repository that is available for read-only

# Potential Uses

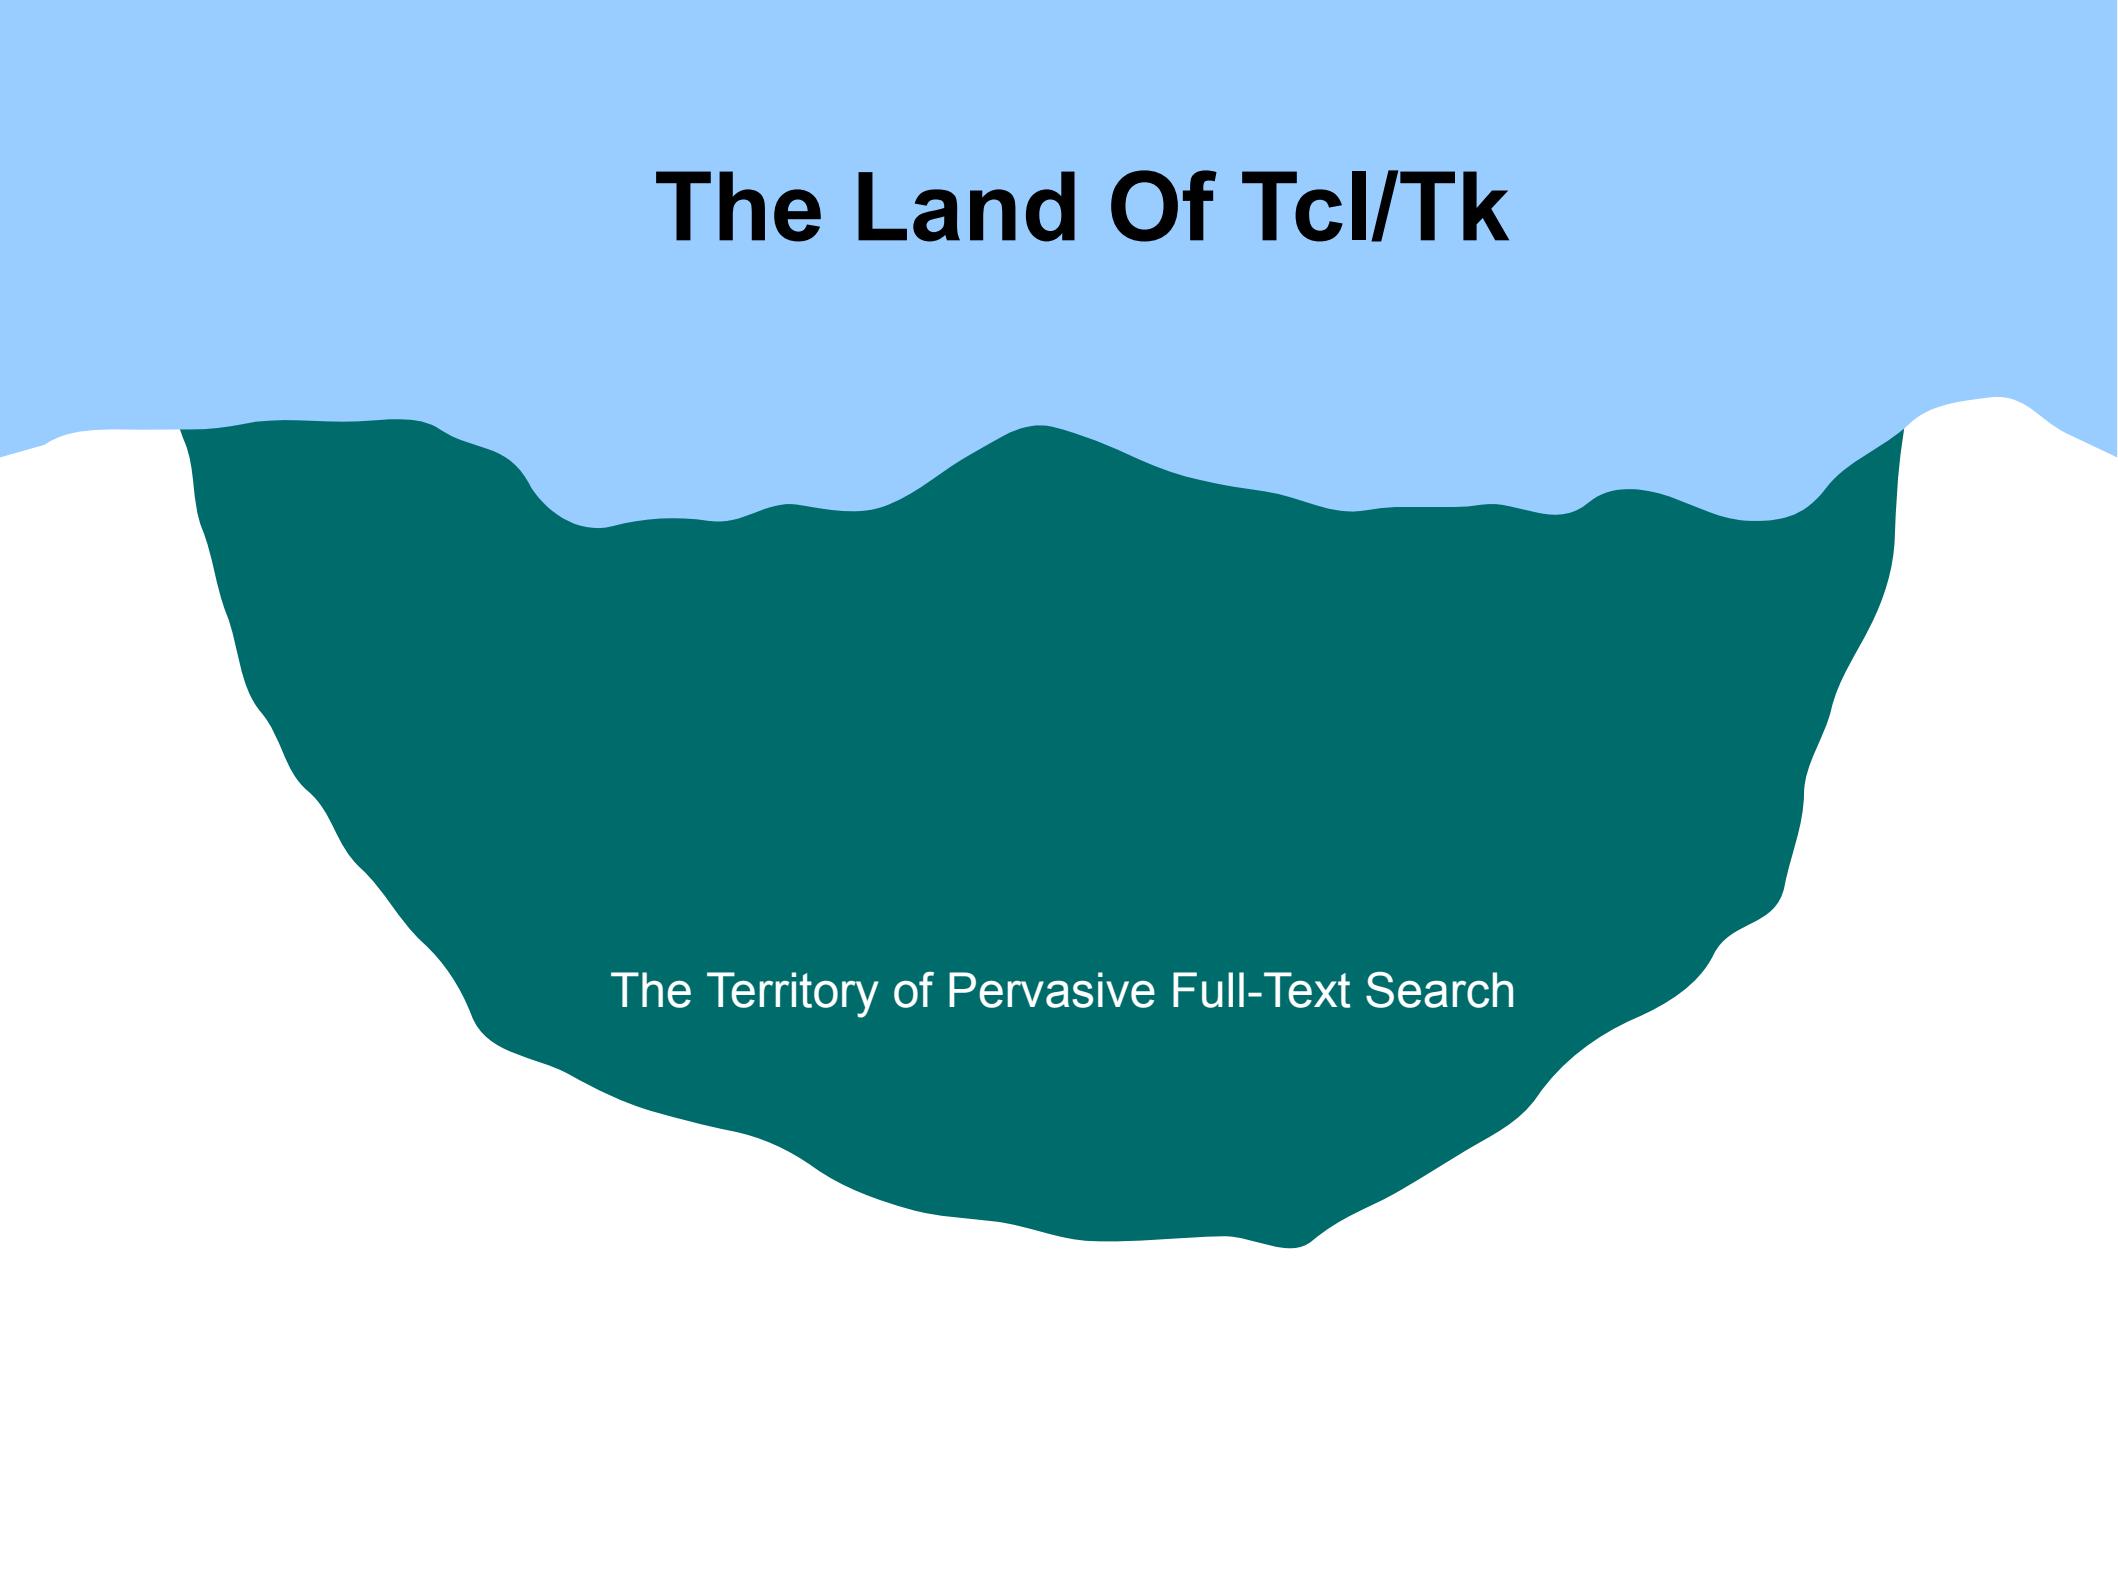

- Search for private websites
- Email Clients
- On-line documentation search
- Searchable history in web browsers
- Chatroom archive search
- Search version diffs in a CM system
- Text editors and IDEs
